

AGENCYOS

SALES OPERATING FLOW

Lead -> WhatsApp -> Relationship -> Requirements -> Call/Meeting Scheduler -> Requirement Confirmation -> Quotation -> Admin Approval -> Negotiation -> Offer/Discount -> Acceptance -> Close -> Follow-up / Handoff

Purpose

A detailed operating specification for the Sales Agent workflow, centered on WhatsApp as the primary communication layer, with controlled call/meeting scheduling, structured requirement memory, quotation governance, negotiation controls, and conversion.

Source basis: This document consolidates the uploaded AgencyOS Master Vision, Complete Business Workflow, AI Agent Architecture, Memory & Context, Admin Control Center, Approval/Policy Engine, WhatsApp Automation, CRM/Sales, Requirements & Scope, Automation/Jobs, Database, API/Integration, Finance, Onboarding and Handover specifications, plus the conversation decisions established for this sales flow.

Important scope note: This PDF intentionally focuses on the lead-to-close sales journey and the direct follow-up/handoff boundary. Post-sale implementation, QA, deployment, maintenance and upsell are referenced only where the sales workflow hands control to another stage.

1. Executive Flow Map

Stage	Primary owner	Outcome / gate
1. Lead arrival	System + Sales Agent	Lead captured, deduplicated, mapped to WhatsApp
2. First contact	Sales Agent	Natural introduction and relationship start
3. Discovery	Sales Agent	Need, business context, constraints and intent understood
4. Communication branch	Sales Agent + Scheduler	WhatsApp OR call OR meeting path selected
5. Call/meeting capture	Scheduler + backend + Sales Agent	Post-call/meeting evidence uploaded and analyzed
6. Requirement consolidation	Sales Agent	Requirements normalized and prepared for confirmation
7. Budget branch	Sales Agent	Known budget OR budget unknown pathway
8. Requirement confirmation	Sales Agent + Client	Confirmed requirement set becomes quotation input
9. Quotation generation	Quotation Master	Versioned quote created from confirmed scope
10. Admin approval	Admin via panel/WhatsApp	Approve / Edit / Cancel decision
11. Client quote release	Sales Agent	Approved quotation shared; conversation remains active
12. Objection handling	Sales Agent	Doubts and commercial objections handled
13. Negotiation	Sales Agent + Policy Engine + Admin where needed	Policy-bound offers/discounts/scope adjustments
14. Acceptance / close	Client + Sales Agent	Exact quote/commercial terms accepted -> WON
15. Payment/onboarding handoff	Finance + PM	Payment/onboarding workflow starts; Sales handoff remains auditable
16. Post-close follow-up	PM / Customer Success as configured	Sales ownership ends except configured commercial follow-up

Canonical lifecycle

Lead -> Sales -> Trust Building -> Quotation -> Admin Approval -> Negotiation -> Won. The CRM specification further models lead states such as NEW, CONTACTED, RESPONDING, QUALIFIED, REQUIREMENTS_PENDING, QUOTE_DRAFT, QUOTE_SENT, NEGOTIATION, AWAITING_ACCEPTANCE, PAYMENT_PENDING, WON, LOST, NURTURE and DISQUALIFIED.

2. Stage 1 - Lead Arrival & Capture

- A prospective lead can arrive from Facebook/Instagram campaign, lead form, direct WhatsApp, website form, referral, manual Admin entry, existing client/repeat inquiry, or another configured source.
- When the configured business WhatsApp receives an unknown number, AgencyOS creates a lead record and stores the source, acquisition timestamp, initial message and available identity information.
- Phone number and email are normalized; duplicate/open-lead checks are performed before creating a new CRM identity.
- If the number already maps to an active client, the interaction should link to that client rather than creating a conflicting identity.
- If a previous lost/closed lead is found, the system preserves history and creates/reopens an opportunity according to policy.
- The incoming event is deduplicated by provider message/event ID. Retries must not produce duplicate leads or duplicate outbound messages.
- Language is detected and the preferred language is remembered. Mixed language/Hinglish is supported.
- The Sales Agent is assigned according to routing rules and receives the relevant lead memory and conversation summary, not unrelated client data.
- The database/workflow state is the authoritative source of business truth; WhatsApp is the communication/evidence layer.

Lead data captured	Examples
Identity	Lead ID, name when known, phone, email when available, company/business name
Acquisition	Source, campaign/ad metadata where available, source URL where relevant, acquisition time
Conversation	Initial message, WhatsApp identity, messages, media references, detected language
Sales context	Lead status, assigned Sales Agent, priority/score, requirements, objections, follow-up status
Governance	Organization scope, permissions, event IDs, audit/correlation IDs

Reference: CRM/Lead Management and WhatsApp Automation define the lead lifecycle, identity, deduplication, language detection, conversation evidence and structured CRM state. [\[filecite\]turn0file10\[filecite\]turn0file1\[](#)

3. Stage 2 - First Contact: Relationship Before Interrogation

- The Sales Agent behaves like an experienced human sales professional: friendly, clear, professional, respectful and natural.
- The first response should introduce the sales identity before asking for the lead's name. Example pattern: "Hi, [name], main Himanshu, BussEnhancer se bol raha hoon. Aapka good name kya hai?" The exact wording should follow the client's language.
- If the lead starts in Hindi, continue in Hindi; if English, continue in English; mixed-language messages can be handled as Hinglish.
- Do not open with a rigid checklist. The qualification specification explicitly says questions should adapt when the conversation already contains the answer.
- The first goal is rapport: learn the person's name, understand the reason for contacting, show interest in the business, and make the interaction feel consultative rather than transactional.
- The agent can use approved portfolio, samples, demos, previous work or case studies to build trust when relevant.
- Trust concerns should activate a trust-building playbook rather than pressure. The playbook may include milestone explanations, proof of work, and approved low-risk commercial structures.
- The Sales Agent should continuously avoid unnecessary repetition and should not ask for information already present in memory.

Sales Agent design principle

Target behavior: highly experienced sales professional with strong discovery, empathy, objection handling, trust building and conversion skills. Autonomy is still policy-bound: the agent may not invent prices, unsupported commitments, delivery promises or out-of-policy discounts.

References: Master Vision, Complete Business Workflow, AI Agent Architecture, CRM/Sales and Memory specifications.
[filecite\turn0file4] [filecite\turn0file3] [filecite\turn0file5] [filecite\turn0file10] [filecite\turn0file6]

4. Stage 3 - Requirement Discovery & Business Understanding

- Once rapport exists, the Sales Agent gradually discovers what the lead wants to build or buy.
- Discovery covers project/service type, target users, platform(s), core features, integrations, design expectations/references, timeline, urgency, business context, existing assets/system, decision-maker status, special requirements, communication language and trust concerns.
- The agent adapts questions to context. It must not interrogate the lead with a rigid checklist when answers are already available.
- The agent separates explicit client facts from AI assumptions. Ambiguous material requirements become clarification items rather than guessed facts.
- Requirements can come from WhatsApp text, voice notes, images, PDFs/documents, forms, emails, calls, meeting notes and other configured channels.
- Voice notes follow: media reference -> transcription -> language detection -> intent/requirement extraction -> context update. Uncertain transcription must not be silently invented.
- The structured requirement set includes priorities, dependencies, acceptance criteria, related features, assumptions, source evidence and confirmation state.
- Qualification and scoring may consider need clarity, budget fit, timeline fit, decision-maker involvement, feasibility, urgency, engagement quality, trust/readiness, service fit and commercial potential. Score supports prioritization; it does not replace judgment.

Requirement status	Meaning
CAPTURED	Extracted from conversation/source but not yet confirmed
CLARIFICATION_REQUIRED	Material information is missing or ambiguous
CONFIRMED	Client explicitly confirms the requirement
REJECTED	Client/agency rejected the item
CONVERTED_TO_SCOPE	Included in the approved scope
OUT_OF_SCOPE	Explicitly excluded
SUPERSEDED / CANCELLED	Replaced by newer requirement or withdrawn

References: Requirements & Scope, CRM/Sales, WhatsApp, Memory. [filecite\[turn0file14\]](#) [filecite\[turn0file10\]](#) [filecite\[turn0file1\]](#) [filecite\[turn0file6\]](#)

5. Stage 4 - Communication Branch: WhatsApp vs Call vs Meeting

This is the most important branch in the user-defined sales experience. The default path is WhatsApp; call/meeting is an exception used when the lead requests it.

Condition	System behavior	Sales behavior	Next
A. Lead wants WhatsApp only	Continue normal WhatsApp conversation; no scheduler required	Relationship -> discovery -> requirements -> confirmation -> quote	Quotation path
B. Lead asks for a call	Sales Agent / Scheduler checks available slots and proposed date/time	Offer available slots; let client choose	Scheduled call
C. Lead asks for meeting	Scheduler checks available slots for configured meeting type (e.g., Google Meet/Zoom or configured channel)	Offer slots appropriate to date request	Scheduled meeting
No date provided	Scheduler finds earliest suitable available date/slot under policy	Offer near-term available options	Client selects
Specific date provided	Scheduler searches that date first	Offer available slots on requested date	Client selects
Requested date has no availability	Scheduler checks next appropriate date/slot	Explain availability naturally; offer alternatives	Client selects / reschedules

6. Stage 5 - Scheduler, Admin Visibility & Reminders

- The scheduler records the selected slot, communication type (call/meeting), client/lead identity, phone/WhatsApp identity, meeting/call date and time, and any requirements already known.
- The scheduled item is stored in AgencyOS and appears in the Admin Panel scheduler/meetings view.
- The scheduler sends the Admin a WhatsApp notification containing the scheduled time, client name/number when known, purpose/context and any known requirements.
- The Admin Panel also receives an app notification so the human owner can see upcoming calls/meetings without opening the lead conversation.
- A reminder job is scheduled before the appointment. The user-defined target is approximately 5-10 minutes before the call/meeting; exact policy can be configurable.
- Reminder delivery can include the internal Admin WhatsApp channel and AgencyOS app notification, according to configuration.
- Scheduled jobs must be timezone-aware, idempotent and safe to retry. A reminder must be re-checked at execution time so it does not fire after the event is cancelled/rescheduled.
- If the scheduler job fails because of a transient provider issue, the job retries with controlled backoff; permanent failures create an exception/escalation rather than silently disappearing.
- Admin WhatsApp approval/notification messages must contain structured references so the backend can validate actions and audit them.

Scheduler record	Required/typical contents
Identity	Lead ID, client/lead name, phone/WhatsApp identity
Appointment	Type, date, start/end time or slot, timezone, channel, status
Context	Known requirements, objective, prior questions, trust/objection context
Admin visibility	Notification reference, acknowledgement/handling state
Reminder	Reminder schedule, delivery channel(s), job ID, state
Audit	Created by/agent, timestamp, event/correlation IDs, reschedule/cancel history

References: Automation/Jobs, Admin Control Center, WhatsApp, API/Integration and CRM specifications. [filecite turn0file12](#) [filecite turn0file7](#) [filecite turn0file1](#) [filecite turn0file22](#) [filecite turn0file10](#)

7. Stage 6 - Post-Call / Post-Meeting Capture

- The scheduled record contains an upload/note area where the human user can attach the conversation evidence after the call or meeting.
- Supported evidence can include audio recording, video recording, image, PDF/document, screenshots, chat exports, plain text notes, tags and other configured files.
- The user explicitly marks the appointment as COMPLETED and uploads the available evidence/notes.
- That completion event triggers an asynchronous backend job. The workflow does not rely on the human remembering to tell the Sales Agent separately.
- The analysis agent extracts what was actually discussed: requirements, decisions, objections, questions, commitments, next actions and other relevant context.
- The original file/media remains linked as evidence where permitted; the structured facts are stored in memory/CRM/project context.
- The Sales Agent is then reactivated with updated context so it can continue the conversation without asking the client to repeat the call/meeting.
- Where material requirement details were discovered in the call/meeting, the agent uses those facts in the next client-facing message and can prepare the requirement confirmation.
- The client-facing message should contain concise, easy-to-read notes or summary from the discussion, not the raw internal recording. Example structure: "As discussed, aapko ..." followed by short points.
- No invented requirement can become confirmed merely because the AI extracted it. Exact requirement confirmation remains a structured client confirmation state.

Critical trigger

USER: Upload evidence + Mark Call/Meeting Completed -> SYSTEM: Create completion event -> ANALYSIS JOB -> Update structured memory -> Trigger Sales Agent -> Continue lead conversation using the new context.

8. Stage 7 - Consolidated Requirement Confirmation

- The Sales Agent combines relevant WhatsApp discovery plus post-call/meeting evidence into one consolidated requirement view.
- The confirmation should be done once after sufficient discovery, not repeatedly after every minor message.
- The client receives a concise confirmation in short notes/points so it is easy to read.
- The confirmation distinguishes required features, important constraints and key assumptions where needed.
- Client may correct, add or remove items. The system records the change without unnecessarily re-sending the entire requirement list for every minor edit.
- Once the client explicitly confirms the requirement set, the exact requirement version becomes the quotation input.
- A generic ambiguous response should not be treated as binding acceptance where the workflow requires explicit confirmation.
- The approved requirement set is versioned and later becomes linked to the quotation/scope baseline.

Client response	System action
"Yes / confirmed"	Set requirement version to CONFIRMED; create/continue quotation workflow
Adds a feature	Update requirement record; re-run impact/normalization only as needed; avoid unnecessary full-message repetition
Removes a feature	Mark that requirement removed/superseded; preserve history
Clarifies wording	Update requirement version after answer; keep source evidence
Ambiguous response	Ask targeted confirmation; do not infer approval
No response	Remain in follow-up/awaiting-confirmation state according to policy

9. Stage 8 - Budget Discovery: Two Distinct Conditions

Condition	What the Sales Agent knows	Quotation strategy
A. Budget disclosed during discovery	Requirement + client budget are both known before quote	Quote should show what is deliverable within the stated budget. If full requirement exceeds budget, prepare structured alternatives such as budget-fit scope vs full requirement scope, within policy.
B. Budget not known	Requirement is known; client says "quote according to requirement"	Prepare quotation from confirmed requirements first; do not invent a budget. Discuss budget only later if price objection appears.

- When the budget is disclosed and it is lower than the requirement-based price, the quotation can present more than one commercially governed option, for example: budget-aligned scope and full-requirement scope. Exact structures remain Admin/policy controlled.
- When the budget is not disclosed, the quote should be requirement-led. The Sales Agent can later ask for a realistic budget when the client objects to price.
- Budget is a sales signal and does not itself authorize a discount or commercial exception.

10. Stage 9 - Requirement Complete -> Quotation Master Trigger

- When the Sales Agent marks requirements as sufficiently complete/confirmed for quotation, a quotation workflow event is created.
- The Quotation Master uses the approved quotation template plus the requirement/scope information to create a quote version.
- Quote content includes client/project identity, line items, quantities, rates, discounts where applicable, taxes/GST mode where configured, total, validity, payment schedule, milestones and terms.
- Quote versioning is mandatory. The exact quotation version becomes the commercial artifact that can be approved, sent, negotiated, accepted or superseded.
- Pricing is configurable and must be sourced from Admin-approved pricing rules. Business examples in the broader AgencyOS documentation are illustrative, not hard-coded universal prices.
- A quote cannot be released when required scope, pricing, payment terms or approval information is missing.

Quote version state	Meaning
DRAFT	Quote being prepared
INTERNAL_REVIEW	Pending internal review where configured
SENT	Client-facing quote released
VIEWED	Viewed where provider can expose this event
NEGOTIATION	Commercial discussion active
ACCEPTED	Exact version accepted
REJECTED	Client rejected
EXPIRED	Validity ended
CANCELLED	Quote withdrawn

11. Stage 10 - Admin Approval via AgencyOS Internal WhatsApp / Panel

- The Quotation Master sends the draft quotation plus a short summary to the Admin internal channel/approval center.
- The approval request identifies the requesting agent, client/project, exact action, amount/value, quotation version, context/evidence, policy and prior approval history.
- Admin can approve, reject/cancel, or request changes. The exact available actions are policy/configuration controlled.
- If the Admin asks for changes, the Quotation Master applies the requested edits, creates the revised quote version and sends it back for approval.
- The previously rejected/superseded quote versions remain historical; the new version does not overwrite the old one.
- Only after backend confirmation of valid approval can the Sales Agent release the approved quote to the lead/client.
- An ambiguous WhatsApp reply such as a generic "okay" must not automatically count as formal approval when explicit approval is required.

Admin decision	Result
APPROVE	Backend records exact version approval; Sales Agent may release it
REQUEST CHANGES / EDIT	Changes are applied; new quote version created; approval requested again
REJECT / CANCEL	Quote is not released; reason is recorded; Sales Agent continues appropriate conversation
EXPIRED / INVALID	Prior approval no longer applies if version/policy/validity has changed; new approval may be required

References: Admin Approval/Policy, Admin Control Center, CRM/Sales, Finance and Master Vision. [filecite turn0file11](#)
[filecite turn0file7](#) [filecite turn0file10](#) [filecite turn0file0](#) [filecite turn0file4](#)

12. Stage 11 - Sales Agent Must Not Go Silent While the Quote Is Being Prepared

- This is a key behavioral requirement from the conversation: the Sales Agent should remain conversationally active while the quotation is being generated/reviewed.
- The agent must continue answering legitimate client questions, acknowledging messages and maintaining context instead of disappearing until the quote is ready.
- The response should be natural and relevant; it should not spam the client with repetitive "quotation is in progress" messages.
- The agent should give only useful updates when needed and preserve the conversation state for the next response.
- The Sales Agent remains the primary owner until the lead is closed/won/lost or another configured owner takes over. On WON, a structured handoff goes to onboarding/Project Manager.

Ownership rule

Sales Agent ownership continues through qualification, discovery, trust building, quotation conversation, objection handling, negotiation and conversion. Quote-generation jobs are asynchronous work behind the conversation; they do not mean Sales ownership has paused.

13. Stage 12 - Approved Quote Sent to Client

- Once the quote is approved, the Sales Agent sends the exact approved quote version to the lead/client via the configured WhatsApp communication flow.
- The agent references the requirement discussion naturally and explains what the quote includes, what is excluded if relevant, timeline assumptions and the next step.
- The client can ask questions about price, feature scope, timeline, payment terms, deliverables or other commercial concerns.
- All negotiation steps remain in sales history and are linked to the opportunity and quote version.
- A new material scope request after quote/approval must be classified rather than silently changing the commercial baseline.

14. Stage 13 - Objection Handling

Objection type	Sales Agent response
Price objection	Acknowledge -> understand budget concern -> identify realistic budget if appropriate -> determine whether approved offer options are relevant
Scope concern	Clarify which deliverable/feature is driving concern; compare against quote and requirement set
Timeline concern	Understand required date and urgency; do not promise unsupported delivery dates
Payment-term concern	Discuss configured milestone/payment options; escalate exceptions
Trust concern	Use approved trust-building playbook: portfolio, proof, milestone explanation, approved low-risk structures
Feature doubt	Explain business value/use case; clarify included vs excluded scope
Decision delay	Understand decision-maker, timing and blockers; schedule appropriate follow-up
Not interested	Do not pressure; record reason and move to configured LOST/NURTURE/DISQUALIFIED state

15. Stage 14 - Negotiation & Offer Logic

- The Sales Agent is designed to maximize conversion while staying inside approved commercial policy.
- The agent can negotiate within configured price ranges, discount limits, offer eligibility and negotiation-round limits.
- The agent cannot invent a discount simply because the client asks repeatedly.
- When the proposed commercial action is outside policy, the Sales Agent creates an Admin approval request instead of making the commitment directly.
- The conversation-defined offer set includes three practical families: discount, value-added benefit, and scope/phase alternative. Exact offers must come from the approved offer catalog/policy rather than improvisation.
- Milestone/payment structure is a separate controlled dimension; negotiation does not erase the existence of milestones.
- The system should choose the smallest commercially necessary concession first, rather than giving all offers at once. This preserves value and reduces unnecessary discounting.

Offer family	Example meaning	Approval behavior
1. Discount	10% / 15% / 20% or other configured discount	Only auto-allowed inside policy; otherwise Admin approval required
2. Value-added offer	Add an approved service/support/benefit without changing the main scope price	Use only approved offers/catalogue; material new benefit may require approval
3. Scope / phase alternative	Keep budget lower by deferring or excluding lower-priority items, or structure phased delivery	Scope/commercial impact must be versioned and approved where required

16. Budget Objection Example - 50,000 Quote -> Client Says "Too Expensive"

- Client says the 50,000 quote is above budget.
- Sales Agent acknowledges the concern and intelligently asks for the client's realistic budget rather than immediately offering a random discount.
- If the client provides 40,000, the agent evaluates what can be done at 40,000 under the configured pricing/scope policy.
- The agent may prepare an approved offer package. For example: a discount option, a value-added option, or a lower-scope/phase option.
- The offer is sent to the Admin WhatsApp/approval flow with context and exact proposed commercial changes.
- Admin sees action buttons such as Approve, Edit/Request Changes and Cancel/Reject, according to the configured approval interaction.
- If Edit/Request Changes is selected, the system updates the offer and creates a new version/request rather than mutating history.
- Only an approved offer is released to the client.
- If the client accepts the approved offer, the commercial state moves toward acceptance. If the client rejects it, negotiation continues or moves to follow-up/lost/nurture depending on context.

17. Admin Offer Approval - Exact Versioned Loop

Step	Action	Evidence/state
1	Sales Agent identifies price objection and proposes an offer candidate inside policy or requests approval	Negotiation activity + offer draft
2	Offer is sent to Admin internal WhatsApp with client, quote, current amount, proposed concession/benefit and rationale	Approval Request ID
3	Admin chooses Approve / Edit-Request Changes / Cancel-Reject	Admin identity + decision
4	Approve -> backend validates still-current quote/policy/version	Approved exact offer version
5	Edit -> Sales/Offer system applies changes and generates revised offer	New version + old version retained
6	Cancel/Reject -> offer cannot be sent	Rejected/cancelled reason
7	Approved offer -> Sales Agent sends only approved client-facing version	Outbound message ID + version
8	Client accepts / declines / counters	Sales history + next action

18. Change Requests During Sales

- If a lead changes requirements before the scope/quote baseline is finalized, the Sales Agent updates the requirement set and the Quotation Master may create a revised quote version.
- If the client requests material scope changes after a quote is accepted, the Requirements/Scope system must classify the request and may require a Change Request rather than silently changing the accepted commercial baseline.
- Possible classifications include IN_SCOPE, SMALL/FREE, PAID_CHANGE, NEW_PROJECT, CLARIFICATION, DUPLICATE and REJECTED.
- Material paid changes follow: request -> classification -> impact analysis -> estimate -> revised quote -> Admin approval where required -> client acceptance -> payment condition -> new scope version.
- Old scope/quote versions remain historical and auditable.

Reference: Requirements & Scope specification. [filecite\turn0file14](#)

19. Stage 15 - Client Acceptance & Close Decision

- A client must accept the exact commercial/quote version being used for conversion when explicit acceptance is required.
- Ambiguous statements should trigger confirmation rather than being treated as binding acceptance.
- When the commercial terms are accepted, the opportunity transitions to WON according to the CRM state model.
- The accepted quote becomes the commercial baseline for onboarding/project/finance workflows.
- The structured handoff includes client identity, sales conversation summary, confirmed requirements/scope, final quotation, negotiated price/payment terms, approved offers/discounts, trust concerns, commitments, language preferences, client expectations, acceptance evidence and next onboarding actions.
- The Sales Agent does not simply drop the context. The receiving Project Manager/Onboarding flow should continue without making the client repeat already-known information.

Close gate

Lead is WON only when the required commercial acceptance evidence exists. The accepted quotation version and confirmed requirement/scope version are carried forward as the downstream commercial baseline.

20. Payment / Onboarding Boundary After Sales Close

- After WON, onboarding begins: client identity, project information, accepted quote/version, confirmed scope, payment plan, target dates, communication preferences, required assets and stakeholders are structured.
- Finance creates invoice/payment instructions from the accepted quote/milestone. Payment submission is separate from payment verification.
- A screenshot or client message saying "paid" is not itself final payment verification where Admin/Finance verification is required.
- Only verified payment can unlock payment-gated project transitions according to policy.
- The Project Manager becomes the primary operational coordinator after conversion/onboarding. Sales may remain available for commercial context but is no longer the primary project operator.

References: Finance, Onboarding/Project Management, Master Vision, AI Agent Architecture. [\[filecite\]turn0file0](#)
[\[filecite\]turn0file9](#) [\[filecite\]turn0file4](#) [\[filecite\]turn0file5](#)

21. Stage 16 - If the Lead Does Not Close

- If the client is not ready now, move to the configured NURTURE/follow-up state with a reason and next scheduled action.
- If the client is genuinely not interested, use LOST with a recorded reason rather than continuing endless pressure.
- If the lead is not a valid fit, use DISQUALIFIED with a reason.
- Follow-ups are scheduled jobs and must be idempotent, timezone-aware and state-aware.
- The system must re-check current lead state before sending a scheduled follow-up, so it does not follow up after a lead has already converted, declined or otherwise reached a terminal state.
- The Sales Agent may automatically send approved samples, portfolio items, demos and follow-ups where configuration allows.
- Communication should be personalized and concise, reflecting the last known context and avoiding repeated text.

Lead state	Meaning	Typical Sales action
QUOTE_SENT	Quote delivered	Monitor response; answer questions; schedule follow-up
NEGOTIATION	Commercial discussion active	Handle objection; policy-bound negotiation
AWAITING_ACCEPTANCE	Terms awaiting decision	Follow up with next-step context
PAYMENT_PENDING	Commercial acceptance exists, payment not complete	Payment/next-step follow-up per configured workflow
NURTURE	Not ready now	Scheduled value-based follow-up
LOST	Not converted	Record reason; future follow-up only if policy/context supports
DISQUALIFIED	Not a valid fit	Close with reason

22. Small-to-Small Conditions & Edge Cases

Situation	Required behavior
Same lead sends multiple WhatsApp messages	Do not create duplicate lead records for each message. Preserve one conversation/lead record.
Same person comes from Facebook + WhatsApp	Match/link identity where safe; preserve source attribution.
Unknown phone match	Do not auto-merge when identity confidence is insufficient; flag for review.
Client changes language	Use the newly detected/preferred language; preserve original messages.
Client sends voice note	Transcribe, detect language, extract facts; keep original media reference.
Voice transcription uncertain	Do not invent meaning; ask a focused clarification if material.
Client asks call after long WhatsApp discovery	Switch to scheduler branch without losing existing context.
Client asks meeting and gives date	Check availability for requested date first.
Client asks meeting without date	Offer the earliest appropriate available slots.
Slot later becomes unavailable	Re-check state and offer alternatives; preserve scheduling history.
Appointment cancelled/rescheduled	Update appointment state and invalidate/recalculate reminder jobs safely.
Call/meeting happens but evidence not uploaded	Do not fabricate notes. Follow configured completion/pending-evidence workflow.
Evidence uploaded but user did not mark completed	Analysis trigger should wait for the configured completion condition; do not pretend the meeting is completed.
Requirement found in call/meeting	Update structured memory and reactivate Sales Agent with new context.
Client only discussed doubts, no new requirement	Save conversation summary and let Sales continue from that context.
Client says feature add/remove before quote	Update requirement state; do not unnecessarily resend full requirement list.

Situation	Required behavior
Client says price is high after quote	Ask realistic budget; do not instantly invent a discount.
Budget known before quote	Use budget to shape quote options; do not exceed policy.
Budget unknown before quote	Create requirement-led quote; discover budget later if price objection emerges.
Discount outside policy	Escalate to Admin; Sales cannot self-approve.
Admin edits an offer	Create a new version; preserve original.
Admin rejects an offer	Do not send it; continue with another approved strategy or follow-up.
Client accepts a superseded quote version	Acceptance must reference the exact current/valid version; stale approval may need re-confirmation.
Quote validity expires	Treat it as expired; generate/revalidate as configured.
Client asks new material feature after acceptance	Classify as scope change/change request; do not silently include it.
Client says "okay" to a governed approval	Do not infer formal approval when explicit approval is required.
Provider/WhatsApp outage	Retry transient failures safely or use configured fallback; surface permanent communication exceptions.
Agent fails repeatedly	Retry -> alternate approved strategy/agent -> human/Admin escalation per policy.
Lead converts while a follow-up job is queued	At execution time re-check state; do not send a sales follow-up after WON.

23. Backend Trigger / Event Architecture for This Sales Flow

- Inbound WhatsApp: provider webhook -> authenticate/verify -> deduplicate -> identify lead/contact -> normalize message -> store message -> classify -> route -> response -> audit.
- Requirement completion event: requirement state transition -> Quotation Master job -> quote draft/version -> policy evaluation -> Admin approval if required -> release event -> Sales Agent sends client quote.
- Scheduler completion event: appointment COMPLETED + evidence uploaded -> analysis job -> structured memory update -> Sales Agent task -> follow-up message.
- Offer approval: Sales offer request -> policy evaluation -> Admin approval/edit/reject -> validated version -> client-facing release.
- Close event: exact commercial acceptance -> WON -> onboarding/project creation event -> structured Sales-to-PM handoff.
- Follow-up: scheduled job -> re-check lead state -> send only if still eligible -> store sent event and provider reference.
- Critical state transitions use durable events and idempotent handlers. Important database state + outbox/event publication should be atomic where required.
- Long-running analysis, transcription, quotation creation and other asynchronous operations should execute through queues/workers rather than blocking synchronous requests.

Event example	Triggered work	Expected outcome
LeadCreated	Sales task	Lead is contacted
MessageReceived	Conversation processing	Lead state/context updated; reply generated
AppointmentScheduled	Reminder job	Admin visibility + reminder scheduling
AppointmentCompleted	Analysis job	Call/meeting context becomes structured memory
RequirementConfirmed	Quotation job	Quote draft/version prepared
QuoteApproved	Client release job	Sales Agent sends exact approved quote
OfferApprovalGranted	Offer release job	Approved offer sent
QuoteAccepted / WON	Onboarding handoff	Project/client onboarding workflow starts

References: Automation/Events, API/Integration, Database, WhatsApp, Memory. [\[filecite\]turn0file12](#) [\[filecite\]turn0file22](#) [\[filecite\]turn0file20](#) [\[filecite\]turn0file1](#) [\[filecite\]turn0file6](#)

24. AI Orchestrator & Model Routing in the Sales Flow

- The Sales Agent role is product logic; the exact model/provider remains configuration. The Orchestrator selects an eligible model based on capabilities, policy, health, cost, quality, latency and availability.
- Sales conversations prioritize quality, reliability, tone and policy compliance. Trust/negotiation may require stronger reasoning and policy compliance.
- Multimodal requirements can trigger models with image/audio understanding where needed.
- Provider outage or validation failure triggers controlled fallback or escalation; model selection must never grant extra permissions.
- Provider credentials remain Admin-controlled and server-side. Agents should not receive raw API keys.

Sales task	Primary capability need	Routing consideration
Routine WhatsApp reply	GENERAL_FAST / GENERAL_HIGH_QUALITY	Low latency + tone
Complex discovery / business reasoning	GENERAL_HIGH_QUALITY	Reasoning + context
Call/meeting evidence analysis	LONG_CONTEXT + MULTIMODAL / structured extraction	Audio/text/document context
Requirement extraction	STRUCTURED_OUTPUT + reasoning	Schema correctness
Objection / trust handling	GENERAL_HIGH_QUALITY / REASONING_HIGH	Tone + policy compliance
Quotation preparation	STRUCTURED_OUTPUT + policy	Exact fields/versioning
Negotiation/offer analysis	REASONING_HIGH + policy	Commercial boundary awareness

25. Security, Permissions & Audit Requirements

- All records are organization-scoped. Project/client access is role- and permission-controlled.
- Sales Agent can access CRM/lead data, approved pricing policies and communication tools, but not secrets or unrestricted production/deployment controls.
- Backend authorization is authoritative; UI buttons are not the security boundary.
- Every sensitive approval, quote version, offer, message event, state transition and governed action should carry stable IDs, timestamps and audit references.
- File uploads are project/lead scoped, access-controlled and separated between client-visible and internal evidence.
- Internal notes, private agent reasoning, credentials, margins and sensitive security data must never be exposed in client-facing messages.
- WhatsApp messages are evidence/communication. Formal financial/commercial state is controlled by structured records and policy, not by arbitrary text alone.

References: Security/Permissions/Audit, Admin Policy, Database, WhatsApp. [filecite:turn0file13](#) [filecite:turn0file11](#) [filecite:turn0file20](#) [filecite:turn0file1](#)

26. Sales Agent Definition of Done - Lead to Close

Area	Done means
Lead capture	Correct lead identity, source, WhatsApp mapping and duplicate checks are recorded
Conversation	Language-aware, natural, friendly, professional communication with contextual memory
Relationship	Trust/interest established; conversation is consultative, not checklist interrogation
Discovery	Need, business, service/project type and key constraints understood
Requirements	Structured requirements with source evidence; assumptions separated; ambiguities surfaced
Communication branch	WhatsApp, call or meeting path handled correctly
Scheduling	Correct slot chosen, Admin visibility present, reminders scheduled safely
Call/meeting evidence	Uploaded/typed evidence analyzed only after configured completion trigger
Memory	Relevant call/meeting context is persisted and available to Sales
Confirmation	Requirement version explicitly confirmed before quote baseline where required
Budget	Known-budget and unknown-budget conditions handled separately
Quotation	Exact version generated from confirmed scope/commercial rules
Admin governance	Required quote/offer approvals captured with exact version and audit trail
Client quote	Only approved/current quote released
Objections	Price, scope, timeline, trust and payment concerns handled professionally
Negotiation	Conversion maximized inside approved commercial policy
Offers	Discount/value/scope alternatives are controlled, versioned and approved where required
Close	Exact commercial acceptance recorded; opportunity moved to WON
Handoff	Sales context transferred to onboarding/PM without forcing client repetition
Follow-up	Non-converting leads receive state-aware, non-spammy follow-up or are moved to LOST/NURTURE/DISQUALIFIED

Final principle

The Sales Agent is optimized for maximum practical conversion, but not at the expense of truth, policy, auditability or client experience. The agent should feel like a highly experienced salesperson, while the backend remains the source of truth and Admin remains the authority for governed commercial exceptions.

Source note: The uploaded documents are the controlling basis for architecture, state, policy, memory, communication, automation, finance, onboarding and governance terminology used above. Where this PDF reflects the user-defined role-play decisions (e.g., relationship-first opening, WhatsApp-first default, call/meeting branch, post-completion evidence upload, concise notes to the client, budget alternatives, and offer approval interaction), those are treated as the requested sales UX overlay on top of the source architecture.
