

AGENCYOS

Client Portal & Project Transparency Specification

Document 16 of the AgencyOS Master Documentation Set

CLIENT DASHBOARD • PROGRESS • REQUIREMENTS • DESIGNS • PROTOTYPES • APPROVALS •
PAYMENTS • INVOICES • DELIVERABLES • HANDOVER

Purpose: Define a secure client-facing workspace where clients can see the current project state, requirements, approved scope, design/prototype versions, milestones, invoices, payments, approvals, deliverables and final handover without depending entirely on WhatsApp conversations.

1. Core Principle

- The Client Portal is the client's transparent source of truth for project status and approved artifacts.
- Clients should see what they need to make decisions without being exposed to internal agency operations, prompts, private notes, internal agent conversations or secrets.
- Every visible artifact should have a clear version/status.
- Client approvals must reference exact versions.
- Client feedback should be connected to the relevant requirement, screen, prototype, milestone or deliverable.
- Financial information shown to the client must come from the Finance system.
- Project progress must be evidence-based, not a manually optimistic percentage.

2. End-to-End Client Experience

INVITATION → LOGIN → CLIENT DASHBOARD → ONBOARDING → REQUIREMENTS →
SCOPE/QUOTE → MILESTONES → UI/DESIGN → PROTOTYPE → DEVELOPMENT
PROGRESS → QA/REVIEW → APPROVALS → INVOICES/PAYMENTS → DELIVERABLES →
HANDOVER → MAINTENANCE/UPSELL.

3. Client Dashboard

- Project name and status.
- Overall progress.
- Current milestone.
- Next milestone.
- Pending client actions.
- Latest approved scope.
- Latest design/prototype.
- Payment status.
- Outstanding invoices.
- Recent updates.
- Upcoming deadlines.
- Open feedback/change requests.
- Recent deliverables.
- Support/contact channel.
- Project health indicators where appropriate.

4. Project Progress

- Progress is derived from milestone/task evidence.
- Show completed, in-progress, blocked and upcoming work.
- Display milestone dates where configured.
- Show dependencies or blockers when client-visible.
- Do not expose internal task details unless configured.
- Explain delays with client-safe reasons where appropriate.
- Progress should distinguish operational progress from payment status.

5. Progress Calculation

- Use configured milestone/task weights rather than arbitrary agent percentages.
- Completed work contributes according to project configuration.
- Blocked work remains visible.
- Client approval dependencies can affect progress.
- Payment gates can affect delivery progression but should not falsely reduce technical progress.
- Manual Admin override of progress requires a reason and audit trail.
- Portal displays the calculation/version used for the visible status.

6. Client Onboarding

- Client profile.
- Company/project information.
- Primary contacts.
- Communication preferences.
- Project brief.
- Brand assets.
- Initial requirements.
- Reference files.
- Access/credentials collection through secure mechanisms where needed.
- Contract/quote acknowledgement.
- Onboarding checklist.
- Client confirmation.

7. Requirements View

- Show approved requirements in client-friendly language.
- Group by module/feature.
- Show requirement IDs where useful.
- Show status: draft, clarification, approved, frozen, changed.
- Allow client comments/clarifications.
- Show what is included and excluded.
- Show requirement version.
- Show scope-freeze date/status.
- Do not allow casual comments to silently change scope.

8. Scope & Change Requests

- Display accepted scope baseline.
- Display included/excluded items.
- Show active scope version.
- Show approved changes.
- Allow client to submit a Change Request.
- Classify request as clarification, included revision or scope change.
- Show impact/price/timeline after formal analysis where appropriate.
- Require explicit approval for paid/material changes.
- Client portal should never treat a new message as an automatic scope modification.

9. Quote & Commercial Transparency

- Display accepted quote/commercial summary.
- Line items.
- Discounts where appropriate.
- Tax mode and configured tax presentation.
- Payment schedule.
- Milestones and amounts.
- Quote version.
- Acceptance status.
- Commercial change history where client-visible.
- Sensitive internal margin/cost data remains hidden.

10. Design Workspace

- Show current UI/design version.
- Theme/design direction.
- Screen inventory where useful.
- Design previews.
- Prototype link/build.
- Design comments.
- Revision count/status where contractually useful.
- Approval controls.
- Previous approved versions.
- Client should always know which version is under review.

11. Design Review Workflow

AGENCY SUBMITS UI → CLIENT REVIEW → COMMENT/APPROVE → FEEDBACK
CLASSIFICATION → REVISION OR CHANGE REQUEST → NEW VERSION → CLIENT REVIEW
→ APPROVAL.

- Approval references exact UI version.
- Client comments remain attached to the reviewed version.
- Approved version becomes a baseline.
- New version does not overwrite the approved baseline.

12. Prototype Workspace

- Web prototype preview where available.
- Mobile prototype/APK delivery where applicable.
- Prototype version/build ID.
- Supported platform/device notes.
- Review instructions.
- Known limitations.
- Feedback submission.
- Approval.

- Previous prototype versions.
- Prototype status should clearly distinguish prototype from production software.

13. Development Progress

- Show development milestone status.
- Feature-level progress where appropriate.
- Completed/in-progress/upcoming modules.
- QA status.
- Known client-visible blockers.
- Expected next review.
- Do not expose source code or internal repository details unless explicitly configured.
- Do not expose internal AI-agent reasoning.

14. QA / Testing Visibility

- Show whether the project is in testing.
- Show high-level test status.
- Show major issues requiring client input.
- Show client acceptance testing tasks where applicable.
- Show release-readiness status at an appropriate level.
- Do not expose sensitive security findings or exploit details by default.
- Technical QA evidence can remain available to Admin/authorized users.

15. Client Approvals

- Approval request ID.
- Artifact type.
- Version/build.
- Submitted date.
- Review deadline where configured.
- Client decision.
- Comments.
- Approver identity.
- Timestamp.
- Approval status.
- Approval can be explicit, rejected, or changes requested.
- Approval should be immutable as a historical record.

16. Approval Types

- Scope approval.
- Quote acceptance.
- UI approval.
- Prototype approval.
- Milestone acceptance.
- Change Request approval.

- Final project acceptance.
- Handover acceptance.
- Each approval is linked to the exact artifact or commercial version it authorizes.

17. Client Feedback

- Comment on screen/feature/deliverable where possible.
- Attach image/file when supported.
- Select feedback category where useful.
- Track status.
- Show agency response.
- Show whether feedback is included, revision, clarification or change request.
- Prevent duplicate feedback where possible.
- Preserve history after resolution.

18. Invoices & Payments

- Show issued invoices.
- Invoice number.
- Issue/due date.
- Amount.
- Tax presentation where applicable.
- Paid amount.
- Balance.
- Status.
- Payment instructions.
- UPI/QR/bank-transfer details according to Finance configuration.
- Payment submission.
- Payment reference/UTR.
- Receipt after verified payment.
- Never expose internal payment credentials or unnecessary sensitive account data.

19. Payment Transparency

- Invoice status: pending, partially paid, paid, overdue or other configured state.
- Payment submitted vs payment verified are distinct.
- Client can upload payment proof if workflow permits.
- Verification is performed by Finance/authorized integration.
- Portal shows verification outcome.
- Milestone payment gates are visible where relevant.
- Do not tell a client that payment is verified merely because proof was uploaded.

20. Milestone View

- Milestone name.
- Description.
- Amount/percentage where client-visible.

- Operational status.
- Payment status.
- Start/target dates.
- Deliverables.
- Client actions.
- Approval status.
- Current blockers.
- Completed milestones.
- Next milestone.

21. Deliverables

- Deliverable name.
- Description.
- Version.
- Related milestone.
- Submission date.
- Review status.
- Approval status.
- Download/preview where supported.
- Release/build identifier.
- Notes/limitations.
- Final deliverables remain linked to the approved project version.

22. Deliverable Approval

AGENCY SUBMITS → CLIENT REVIEWS → CLIENT APPROVES / REQUESTS CHANGES → REVISION OR CHANGE REQUEST → RESUBMIT → APPROVAL.

- Each submission has a unique version.
- Approval cannot silently approve a later version.
- Rejected versions remain historical.
- Approved deliverables are locked as baselines.

23. Final Handover

- Final project status.
- Final approved scope.
- Final UI/prototype references.
- Production build/version.
- Source-code handover where contractually included.
- Credentials/access handover through secure mechanisms.
- Documentation.
- Deployment information.
- Environment/configuration references.
- User/admin guides where included.
- Known limitations.

- Maintenance/support terms.
- Final invoice/payment status.
- Client handover acceptance.

24. Handover Checklist

- All contractual deliverables present.
- Final build identified.
- Final documentation present.
- Access transfer complete.
- Production environment confirmed.
- Monitoring/support information supplied where included.
- Outstanding issues disclosed.
- Final payment/financial status confirmed.
- Client acceptance captured.
- Handover timestamp and owner recorded.

25. Maintenance After Handover

- Show maintenance/support status.
- Support period.
- Open support tickets where portal supports them.
- Bug vs new-feature classification.
- Maintenance requests.
- Change requests.
- Renewal/expiry dates.
- Upsell opportunities should be handled through controlled commercial workflow rather than intrusive portal behavior.

26. Client Notifications

- New project/milestone.
- Requirement clarification requested.
- UI ready for review.
- Prototype ready.
- Approval required.
- Invoice issued.
- Payment received/verified.
- Payment due/overdue.
- Deliverable ready.
- Change Request awaiting approval.
- Project milestone completed.
- Handover ready.
- Notification channels: portal, email, WhatsApp or configured channels.

27. Client Communication Center

- Client can see official project messages.

- Messages can link to requirements, milestones, invoices, approvals and deliverables.
- WhatsApp remains a communication channel; the portal remains the structured source of truth for formal records.
- Important approvals should be captured through explicit portal actions or configured formal communication workflow.
- Conversation history should not replace structured project records.

28. Client Access & Permissions

- Client Admin.
- Client Project Manager/contact.
- Client Viewer.
- Additional client users where configured.
- Each role has limited access.
- Client users cannot access internal agency notes, agent prompts, internal costs, credentials or unrelated projects.
- Project-level isolation is mandatory.

29. Authentication & Security

- Secure login.
- Email verification where configured.
- Password reset.
- Optional MFA.
- Session management.
- Role-based access.
- Project authorization checks.
- Secure file access.
- Audit login/access events.
- Rate limiting.
- Secure invitation/revocation.
- Sensitive financial and credential data must be protected.

30. File & Document Access

- Project-scoped files.
- Versioned files.
- Preview/download permissions.
- Upload restrictions.
- File size/type policy.
- Virus/security scanning where available.
- Access logs.
- Expiration/revocation where required.
- Final deliverables should remain accessible according to contract/retention policy.

31. Client Dashboard States

- Not started.
- Onboarding.
- Active.

- Waiting for client.
- Waiting for payment.
- In production.
- QA/testing.
- Completed.
- Maintenance.
- Paused.
- Cancelled.
- Each state should have a client-friendly explanation and next action.

32. Waiting-for-Client System

- Identify the exact action needed.
- Show deadline where applicable.
- Provide action button.
- Send reminders.
- Escalate after configured duration.
- Do not count agency waiting time as development failure without context.
- Record client response.
- Resume workflow automatically after required approval/payment/input is received.

33. Transparency Without Overexposure

- Client sees progress and evidence relevant to their project.
- Internal agent conversations remain private.
- Internal prompts/model reasoning remain private.
- Internal margins/costs remain private unless intentionally exposed.
- Security-sensitive technical details remain restricted.
- Internal staff performance metrics remain private.
- Client-facing explanations should be clear and non-technical where possible.

34. Portal ↔ AgencyOS Integration

- CRM supplies client/project identity.
- PM supplies project lifecycle.
- Requirements system supplies scope.
- UI system supplies design/prototype versions.
- Development system supplies build/progress status.
- QA supplies release/readiness status.
- Finance supplies invoices/payment status.
- Communication system supplies notifications.
- Admin/Policy Engine controls permissions and visibility.

35. Client Portal as a Read Model

- Portal should consume authoritative records from AgencyOS services rather than creating conflicting duplicate truth.
- Visible data should have source system and version.

- Write actions create controlled workflow events.
- Portal should not directly mutate financial or deployment records without authorization.
- Cached status must have a freshness policy.

36. Audit Trail

- Client login.
- File access.
- Comments.
- Approvals/rejections.
- Scope confirmations.
- Change requests.
- Payment submissions.
- Payment proof uploads.
- Document downloads where policy requires.
- User invitations/removals.
- Final acceptance.
- Audit records include actor, timestamp, object/version and action.

37. Admin Controls

- Create/revoke client access.
- Assign client roles.
- Configure visible modules.
- Approve portal publication.
- Control client-visible status.
- Manage notifications.
- Set review deadlines.
- Manage document visibility.
- Review client activity.
- Override supported visibility/status with reason.
- Lock project after completion.
- Configure retention/access policies.

38. PM Agent Responsibilities

- Keep project status accurate.
- Publish client-safe updates.
- Request client actions.
- Coordinate review cycles.
- Ensure milestone records are current.
- Prepare deliverables for client review.
- Trigger approval workflows.
- Classify client feedback.
- Coordinate handover.
- Never invent progress to make the dashboard look healthy.

39. Client Portal AI Guardrails

- AI-generated summaries must be grounded in project records.
- AI cannot fabricate completion, payment verification or approval.
- AI cannot change scope from conversational inference.
- AI must distinguish known facts, pending actions and uncertainty.
- AI client-facing messages should be reviewed or policy-controlled for sensitive events.
- AI must not reveal internal prompts, private memory or confidential agency data.

40. Client Experience Metrics

- Pending approvals.
- Average client response time.
- Review turnaround.
- Payment turnaround.
- Open change requests.
- Milestone completion.
- Support response where applicable.
- Portal engagement.
- Abandoned onboarding.
- These metrics should be used for workflow improvement, not exposed as internal performance judgments unless intended.

41. Example Client Journey

Client receives invitation → logs in → sees project dashboard → reviews scope → approves quote → sees 20% advance invoice → submits payment → Finance verifies → milestone unlocks → UI design appears → client reviews/requests changes → UI V2 approved → prototype appears → client approves prototype → development progress updates → QA/review → final deliverables → final invoice/payment → client confirms completion → handover checklist → maintenance.

42. Preventing Client Confusion

- Always show current version.
- Always show next required action.
- Separate draft from approved.
- Separate submitted payment from verified payment.
- Separate prototype from production.
- Separate revision from scope change.
- Show reasons for blocked/waiting states.
- Use consistent terminology across WhatsApp, portal and documents.

43. Acceptance Criteria

- Client dashboard exists.
- Project progress is evidence-based.
- Requirements and scope are visible.
- Scope versions are identifiable.

- Design and prototype versions are reviewable.
- Approvals reference exact versions.
- Change requests are structured.
- Invoices and payment status are visible.
- Payment submission and verification are distinct.
- Receipts are available according to policy.
- Milestones show operational and financial status.
- Deliverables are versioned and accessible.
- Final handover has a checklist and acceptance.
- Client roles and permissions are enforced.
- Internal agency information remains protected.
- Portal integrates with authoritative AgencyOS systems.
- Client notifications are configurable.
- Audit history exists.
- AI cannot fabricate project, payment or approval status.

44. Final Architecture

CLIENT LOGIN → DASHBOARD → REQUIREMENTS/SCOPE → QUOTE → MILESTONES →
DESIGN REVIEW → PROTOTYPE REVIEW → DEVELOPMENT/QA VISIBILITY →
INVOICES/PAYMENTS → DELIVERABLES → APPROVALS → FINAL HANDOVER →
MAINTENANCE

The Client Portal is the transparency layer between AgencyOS and the client. It turns the internal multi-agent workflow into a clear client experience without exposing internal agency operations.

Key outcome: the client should always be able to answer — what is happening, what has been approved, what is pending from me, what have I paid, what am I receiving, what version is current, and what happens next.
