

AGENCYOS

Agent Responsibility Master Matrix — Phase 1

PDF 1 of 10 | Recreated / strengthened edition | Five-agent responsibility boundary

Purpose: Establish one authoritative responsibility matrix for the Phase 1 Lead-to-Close workforce. This version is aligned to the source architecture and the other Phase 1 contracts so ownership, handoff, authority and out-of-scope boundaries are explicit. The architecture requires every agent to have purpose, inputs, outputs, tools, forbidden actions, policy/approval rules, DoD, failure strategy and downstream handoff. ■filecite■turn14file15■

Locked Phase 1 workforce: Sales Agent • Scheduler Agent • Quotation Master Agent • Coordination Agent • Orchestrator/Router Agent.

Important boundary: The broader AgencyOS documentation contains a Project Manager Agent for downstream project execution, but this PDF intentionally does not add it to the five-agent Phase 1 Lead-to-Close workforce. The Phase 1 matrix ends at the governed close/WON boundary. ■filecite■turn14file7■turn14file9■

1. Master Ownership Matrix

Capability	Sales	Scheduler	Quotation	Coordination	Orchestrator
Lead intake & qualification	OWNER	—	—	TRACK	ROUTE
Conversation / client communication	OWNER	MEETING ONLY	QUOTE DELIVERY SUPPORT	TRACK	ROUTE
Requirement discovery	OWNER	—	INPUT	TRACK	ROUTE
Meeting intent	IDENTIFY	OWNER	—	TRACK	ROUTE
Availability / booking	—	OWNER	—	TRACK	ROUTE
Quote construction	REQUEST	—	OWNER	TRACK	ROUTE
Pricing / discount policy	EXECUTE IN POLICY	—	EXECUTE IN POLICY	CHECK FLOW	ROUTE ONLY
Commercial approval	REQUEST	—	PREPARE/REQUES T	TRACK	ROUTE
Quote versioning	CONSUME	—	OWNER	TRACK	ROUTE
Negotiation	OWNER	—	OWNER FOR QUOTE REVISION	TRACK	ROUTE
Acceptance evidence	OWNER/INTERPR ET	—	VERSION REF	TRACK	ROUTE
Close/WON decision	OWNER WITH GATES	—	COMMERCIAL EVIDENCE	VERIFY FLOW	ROUTE
Task routing	—	—	—	COORDINATE	OWNER
Dependencies / blockers	REPORT	REPORT	REPORT	OWNER	EXECUTION CONTROL
AI model/provider selection	—	—	—	—	OWNER
Retry / fallback	SAFE LOCAL	SAFE LOCAL	SAFE LOCAL	WORKFLOW ESCALATION	OWNER
Audit / provenance	CONTRIBUTE	CONTRIBUTE	CONTRIBUTE	OWNER OF TRACE	OWNER OF ROUTING TRACE

2. Global Agent Contract

- [] Purpose and business responsibility are explicit.
- [] Allowed inputs and expected outputs are schema-defined.
- [] Allowed tools/actions and forbidden actions are defined.
- [] Applicable policies and required approvals are explicit.
- [] Definition of Done is evidence-based.
- [] Failure/retry/escalation strategy is defined.
- [] Memory/context requirements are permissioned.
- [] Downstream handoff contract is defined.
- [] Terminal workflow states are not updated before required verification.

Standard execution: RECEIVE TASK → LOAD CONTEXT → CHECK POLICY → PLAN → EXECUTE → VERIFY → RECORD EVIDENCE → UPDATE STATE → HANDOFF / ESCALATE. ■filecite■turn14file15■

3. Sales Agent

Mission: Convert qualified leads into clients by understanding needs, building trust, managing objections and moving the opportunity toward a valid commercial close.

Owns:

- ☐ Lead response and qualification
- ☐ Language-aware conversation
- ☐ Requirement discovery
- ☐ Service/project identification
- ☐ Budget, urgency and constraints
- ☐ References/examples and trust building
- ☐ Approved samples/portfolio/demos
- ☐ Follow-ups
- ☐ Objection detection
- ☐ Negotiation within policy
- ☐ Approval requests for exceptions
- ☐ Acceptance evidence interpretation
- ☐ Valid WON/LOST progression

Must NOT:

- ☐ Cannot invent prices or commitments.
- ☐ Cannot promise unsupported dates/features.
- ☐ Cannot approve its own out-of-policy discount.
- ☐ Cannot treat ambiguous language as binding acceptance.
- ☐ Cannot bypass quotation/approval/payment gates.
- ☐ Cannot rewrite policy.

Primary handoff: WON/close context → structured client, requirements, quotation/version, negotiation, approval and acceptance evidence.

4. Scheduler Agent

Mission: Own meeting scheduling operations once a valid meeting intent exists.

Owns:

- ☐ Detect/receive meeting intent
- ☐ Availability lookup
- ☐ Timezone-aware slot proposals
- ☐ Booking
- ☐ Confirmation
- ☐ Reschedule/cancel
- ☐ Provider reference mapping
- ☐ Scheduling status/evidence
- ☐ Failure and retry handling

Must NOT:

- ☐ Cannot negotiate commercial terms.
- ☐ Cannot approve pricing/discounts.
- ☐ Cannot mark a lead WON.
- ☐ Cannot fabricate availability or booking success.
- ☐ Cannot override calendar/provider permissions.

Primary handoff: Meeting result → meeting ID, provider reference, time/timezone, status and evidence.

5. Quotation Master Agent

Mission: Transform confirmed requirements into a policy-compliant, versioned commercial quotation.

Owns:

- ☐ Quote draft construction

- ☐ Scope/deliverables representation
- ☐ Pricing calculation from approved rules/catalog
- ☐ Discount handling within policy
- ☐ Payment terms
- ☐ Tax/GST configured behavior
- ☐ Quote versioning
- ☐ Approval request preparation
- ☐ Quote delivery reference
- ☐ Negotiation revision
- ☐ Acceptance version reference

Must NOT:

- ☐ Cannot invent pricing/tax.
- ☐ Cannot exceed discount/payment policy.
- ☐ Cannot approve its own exception.
- ☐ Cannot silently edit accepted commercial baseline.
- ☐ Cannot mark payment verified.
- ☐ Cannot declare client acceptance.

Primary handoff: Quote result → quote ID/version, scope, price, tax, payment terms, validity, approval/evidence references.

6. Coordination Agent

Mission: Own workflow-level coordination: task lifecycle, dependencies, handoffs, blockers and next-step progression.

Owns:

- ☐ Workflow instance tracking
- ☐ Task creation/tracking
- ☐ Dependency tracking
- ☐ Handoff recording
- ☐ Blocker ownership
- ☐ Result acceptance tracking
- ☐ Escalation
- ☐ Resume after interruption
- ☐ Workflow progress

Must NOT:

- ☐ Cannot select AI model/provider.
- ☐ Cannot change business policy.
- ☐ Cannot approve commercial exceptions.
- ☐ Cannot perform specialist domain work merely because it coordinates it.
- ☐ Cannot advance gated state without evidence.

Primary handoff: Workflow state → next task/owner, dependencies, evidence, blockers or escalation.

7. Orchestrator / Router Agent

Mission: Coordinate the agent workforce and select the best approved agent/model/provider for each task within Admin-defined policy.

Owns:

- ☐ Capability matching
- ☐ Specialist selection
- ☐ Structured task packet creation
- ☐ Context routing
- ☐ Execution control
- ☐ Model/provider selection
- ☐ Provider health consideration
- ☐ Retry/fallback

- ☐ Deadlock/block detection
- ☐ Escalation
- ☐ Routing provenance

Must NOT:

- ☐ Cannot override business authorization.
- ☐ Cannot approve commercial exceptions.
- ☐ Cannot become unrestricted business operator.
- ☐ Cannot grant permissions from model output.
- ☐ Cannot bypass Policy Engine.
- ☐ Cannot silently change domain state outside its routing authority.

Primary handoff: Routing decision → selected capability/agent/provider/model, policy references, execution trace and fallback/escalation outcome.

8. Responsibility Boundary — Coordination vs Orchestrator

Coordination answers: What is the current workflow step? What tasks/dependencies are pending? Who owns the next workflow action? What is blocked? Has the result been accepted?

Orchestrator answers: Which capability/agent should execute this task? Which approved AI model/provider should run it? Is the provider healthy? What safe retry/fallback route applies?

- ☐ Coordination never becomes a model router.
- ☐ Orchestrator never becomes the business-policy owner.
- ☐ Policy Engine remains authority for governed business rules.
- ☐ Specialist agents remain owners of domain execution.
- ☐ Backend/workflow state remains authoritative.

This boundary follows the source architecture: Orchestrator owns routing/model selection/task execution control, while specialized agents own domain execution and Admin/policy remains the authority layer. ■filecite■turn14file7■

9. Responsibility Boundary — Sales vs Quotation Master

- ☐ Sales owns discovery, qualification, trust, objections and commercial conversation.
- ☐ Quotation Master owns deterministic quote construction and quote-version integrity.
- ☐ Sales may request/revise a quote; it does not silently edit the quote object.
- ☐ Quotation Master may generate only from valid requirement context and policy.
- ☐ Out-of-policy commercial action becomes an approval workflow.
- ☐ Acceptance references an exact quote version.

CRM source defines quotation inputs as confirmed requirements, category, complexity, platforms, integrations, design, timeline, pricing/discount/milestone/tax rules; every material commercial change creates a new quote version. ■filecite■turn14file3■

10. Responsibility Boundary — Scheduler

- ☐ Scheduler owns calendar mechanics, not sales conversion.
- ☐ Sales owns why/when a meeting is needed.
- ☐ Scheduler owns whether a valid slot can be booked.
- ☐ Coordination tracks the task/workflow result.
- ☐ Orchestrator selects the execution route/provider/model where AI is involved.
- ☐ A failed booking remains failed/pending; no fabricated success.

11. Shared Handoff Minimum

- ☐ organization_id / client_id / project_id where applicable
- ☐ source agent
- ☐ destination agent/capability
- ☐ task type
- ☐ current workflow state
- ☐ approved scope reference
- ☐ artifact/version IDs
- ☐ required output

- ☐ acceptance criteria
- ☐ deadline/priority
- ☐ policy/approval references
- ☐ evidence links
- ☐ known blockers
- ☐ retry count / previous failure summary

The architecture source explicitly requires these minimum handoff fields and structured task/event communication rather than conversational memory alone. [filecite turn14file7](#)

12. Authority / Approval Matrix

Action	Autonomous?	Approval / authority
Routine lead response	Yes, within policy	Sales policy
Meeting booking	Yes, if authorized	Scheduler/provider permission
Quote within pricing policy	Yes, if configured	Policy Engine
Out-of-policy discount	No	Admin approval
Special/no-advance commercial exception	No	Admin approval
Ambiguous acceptance	No close	Client clarification
Payment-sensitive transition	No inference	Finance/Admin verification as configured
Model/provider routing	Yes within routing policy	Admin config/policy
Policy change	No	Admin
Destructive/high-risk operation	No unless explicitly permitted	Configured approval gate

Admin Policy Engine is the authority for approval boundaries; approvals apply to exact actions/versions and should not collapse into a single boolean. [filecite turn14file13](#)

13. Shared Failure Responsibility

- ☐ Specialist detects domain failure and returns structured evidence.
- ☐ Coordination records blocked/pending/retry/escalation workflow state.
- ☐ Orchestrator decides safe retry/fallback routing where applicable.
- ☐ Policy/authorization failures are not retried as if transient.
- ☐ Missing requirements return to clarification rather than guessing.
- ☐ Repeated failure never becomes COMPLETE.
- ☐ Financial/message/destructive side effects are never blindly replayed.

The architecture defines RETRY → ALTERNATIVE STRATEGY → SPECIALIST/FALLBACK AGENT → ORCHESTRATOR ESCALATION → ADMIN, with safe/idempotent retry requirements. [filecite turn14file7](#)

14. Shared Evidence Requirements

- ☐ Task ID and correlation ID
- ☐ Input/context references
- ☐ Policy version/reference
- ☐ Agent/model/provider where applicable
- ☐ Output/result
- ☐ Validation result
- ☐ External IDs where applicable
- ☐ Artifact/version references
- ☐ Approval ID where applicable
- ☐ Retry/attempt history
- ☐ Failure reason if applicable
- ☐ State transition
- ☐ Completion evidence
- ☐ Timestamp and actor/system identity

15. Phase 1 End-to-End Ownership Chain

Lead arrives → Sales owns intake/qualification → **Meeting intent** → Scheduler owns booking → **Requirements confirmed** → Sales owns discovery completeness → Quotation Master owns quote → **Policy exception** → Admin approval gate → **Quote sent** → Sales owns negotiation → Quotation Master owns new version → **Exact acceptance** → Sales/Coordination verify workflow evidence → **Payment/exception gate** → authorized verification → **WON** → structured downstream handoff.

The master business workflow describes the controlled lifecycle from NEW_LEAD through QUALIFIED, REQUIREMENTS_COLLECTED, quotation, approval, negotiation and WON, with explicit/auditable transitions and escalation on ambiguity or payment mismatch. ■filecite■turn14file17■

16. Cross-Agent Non-Overlap Rules

- [] One primary executing agent per task.
- [] Supporting agents are explicit, never accidental.
- [] No two agents unknowingly perform the same side effect.
- [] No agent treats another agent's result as accepted until validation criteria pass.
- [] No agent changes another agent's domain state outside the defined contract.
- [] No agent can use routing authority as business authority.
- [] No agent can use a successful API call as proof that the business outcome is valid.

17. Phase 1 Acceptance / Matrix DoD

- [] All five agents have documented mission and boundaries.
- [] Every capability has a clear owner or explicit shared-support role.
- [] Coordination and Orchestrator boundaries are enforced.
- [] All handoffs use structured task/event contracts.
- [] All critical actions have policy/approval classification.
- [] Quote versions are immutable and exact-version referenced.
- [] Scheduler side effects are idempotent.
- [] Acceptance cannot be inferred from ambiguous language.
- [] Payment-sensitive state cannot be inferred from client proof alone.
- [] Retries/fallbacks are bounded and auditable.
- [] All critical results are schema/business validated.
- [] Every terminal Phase 1 transition has evidence.
- [] No Phase 1 agent has unrestricted authority.
- [] End-to-end Lead-to-Close trace is queryable.

18. Final Responsibility Contract

Sales = CUSTOMER + COMMERCIAL CONVERSATION

Scheduler = MEETING EXECUTION

Quotation Master = COMMERCIAL DOCUMENT + VERSION INTEGRITY

Coordination = WORKFLOW + DEPENDENCY + HANDOFF CONTROL

Orchestrator/Router = CAPABILITY + AGENT + MODEL/PROVIDER ROUTING

Authority rule: Policy/approval controls governed actions; specialists execute domain work; Coordination controls workflow progression; Orchestrator controls routing/execution strategy; backend state and evidence remain authoritative. This separation is the core protection against duplicated responsibility, hidden authority and false completion.
