

AGENCYOS

Complete Business Workflow

Document 02 — Lead to Maintenance & Upsell

LEAD → SALES → ONBOARDING → PAYMENT → DESIGN → PROTOTYPE → DEVELOPMENT →
QA → HANDOVER → MAINTENANCE → UPSELL

1. Workflow Philosophy

AgencyOS must operate the real agency journey, not a generic CRM workflow.

Canonical lifecycle: Lead → Sales → Trust Building → Quotation → Admin Approval → Negotiation → Won → Onboarding → Project Setup → Payment → Project Start → Design → Client Review → Prototype → Client Review → Milestone Payment → Development → Client Review → QA → Final Payment → Handover → Completion → Maintenance/Upsell.

- Every major stage has a defined owner/AI agent.
- Every important transition has evidence.
- Commercial and high-risk actions are governed by Admin approval policies.
- WhatsApp is a primary communication channel; AgencyOS remains the structured source of truth.
- No agent may declare a stage complete without its Definition of Done.

2. Actors

- Client — real human; reviews deliverables, provides feedback/approvals and makes payments.
- Super Admin / Owner and Admin — real humans; retain business authority.
- Sales Agent — lead handling, requirement discovery, trust building, quotation, objection handling and conversion.
- Project Manager Agent — project orchestration, client-group communication, milestone control and handoffs.
- UI Designer Agent — scoped UI design and design versions.
- Prototype Agent — prototype build preparation.
- Developer Agents — coding, implementation, builds and engineering.
- QA Agent — testing, defects, regression and production readiness.
- Finance Agent — invoices, GST/non-GST workflow, payment instructions and verification.
- Support, Customer Success and Upsell Agents — support, retention and growth.
- Orchestrator/Router Agent — coordinates agents and selects AI providers/models according to policy.

3. Lead Arrival

A prospective client may arrive through a Facebook advertisement and send a WhatsApp message.

- Identify the WhatsApp number and create a lead if new.
- Store source, date/time, initial message and available identity.
- Classify service/project category as information becomes available.
- If the number belongs to an existing completed client, create a new opportunity under that client instead of an unintended duplicate.
- Sales Agent responds naturally in the client's language.
- Support text and voice-note conversations.
- Maintain a friendly, professional tone.
- Keep the interaction history in the backend.

4. Sales & Requirement Discovery

- Ask what the client wants to build and identify platform requirements.
- Ask for references, examples, existing designs, business information and constraints.
- Identify target users, features, scope, desired experience, urgency and objections.
- Convert conversation into structured requirements.

- Detect trust concerns, budget concerns and other objections.
- Use approved samples, portfolio, previous work, demos and follow-ups automatically.

Trust-building mode: when the client fears losing money or not receiving the work, the Sales Agent switches to an approved trust-building playbook.

- Explain milestone-based delivery and transparent approvals.
- Possible approved structures include smaller advance + UI/prototype validation or an exceptional limited/no-advance start.
- AI must never invent a commercial commitment; exceptions are policy/Admin controlled.

5. Requirement Consolidation & Quotation

After sufficient discovery, the Sales Agent tells the client that requirements are understood and a detailed quotation/proposal will be prepared.

- Structure requirements into scope, features and deliverables.
- Recommend commercial structure, timeline and pricing according to policy.
- Generate quotation/proposal.
- Example: single-vendor e-commerce may have different pricing for app + admin, website + admin, or app + website + admin.
- Multi-vendor e-commerce is higher complexity and may use a higher configured price range.

These are business examples, not hard-coded universal prices. Pricing must remain configurable.

6. Admin Approval Before Client Quote

The Sales Agent must not send a governed quotation, offer, discount or special commercial commitment until the required Admin approval is obtained.

- Create quotation version with scope, price, discount, payment terms and reasoning.
- Send structured approval request to the AgencyOS internal WhatsApp group and/or Admin approval center.
- Admin can approve, reject or request changes.
- Persist Admin identity, timestamp, exact quotation version and evidence.
- Only after approval may the client-facing quote be released.

If a quote is fully inside an Admin-approved automatic pricing policy, autonomous execution may be allowed. Outside policy requires explicit approval.

7. Negotiation & Conversion

- Client may object to price, scope, features, timeline or payment terms.
- Sales Agent handles objections using experienced sales strategies.
- AI tries to maximize conversion while staying inside commercial policy.
- Discounts, offers and payment exceptions are governed by configured boundaries.
- Outside policy → Admin approval.
- Every negotiation step remains in sales history.
- When client accepts, opportunity becomes WON and onboarding starts.

8. Client Onboarding & Project Group

- Collect client name, email/Gmail and other required details.

- Ask whether the client has GST and whether a GST bill is required.
- Collect project name and required project information.
- Create the project WhatsApp group using the configured project naming convention.
- Set project logo where supported.
- Add Owner/Admin, required agency staff and the client.
- Client may add their own participants where supported.
- Client-facing identity remains professional; internal AI-agent architecture is not exposed.
- Store group identity/connection in AgencyOS.

9. Scope & Payment Plan

- Store approved quotation and final negotiated price.
- Store final scope, requirements, approved offers and discounts.
- Store milestone/payment plan.

Common example: 30% advance → 20% after UI/prototype → 30% after development → 20% final/testing. Actual plans are configurable and may be selected by AI inside policy.

- Before invoice/payment instructions, AI asks about GST/non-GST billing.
- Payment instructions may use business/current account where required and approved savings-account details where permitted.
- Supported methods include bank transfer, UPI and QR code, subject to configuration.

10. Advance Invoice & Payment Verification

- Finance/Project Manager Agent creates invoice from approved quotation and milestone.
- Invoice is shared by approved channels such as email and project WhatsApp group.
- Client may send screenshot, UTR/reference or payment message.
- AgencyOS records payment proof as PENDING_VERIFICATION.
- Agent sends structured verification request to Admin with client, invoice, expected/claimed amount, proof and evidence.
- Admin verifies payment.
- Only Admin confirmation makes payment VERIFIED for payment-sensitive project transitions.
- Audit record stores verifier, timestamp, amount, invoice and evidence.
- Project group receives payment-received confirmation after verification.

11. Official Project Start

- Required onboarding information is complete.
- Approved scope exists.
- Required payment condition is verified.
- Required Admin approvals exist.
- Project Manager Agent marks the project officially started and records start date.
- Project-start announcement is sent to the project group.
- Project Manager Agent becomes the primary operational coordinator.

12. UI Design

- UI Designer Agent reads approved scope and requirements.

- Design every relevant scoped screen and feature.
- Generate 2–3 visual/theme directions where appropriate.
- Use different color/theme combinations when useful.
- Never silently add out-of-scope functionality.
- Preserve design versions.
- Submit design package for Admin review before client release where configured.
- Admin approves or requests changes; approval is linked to the exact version.
- Project Manager/approved agent shares UI in the project WhatsApp group.
- Client is asked to review theme, colors, additions/removals and overall experience.
- Client feedback becomes structured revision tasks.
- Explicit client approval marks the exact version CLIENT_APPROVED.

13. UI Prototype

After UI approval, build a functional prototype that lets the client experience the intended product flow.

- Use approved UI as the reference.
- Example e-commerce deliverables may include customer APK and hosted admin-panel web prototype; actual deliverables depend on scope.
- Admin review/approval may be required before client release.
- Run smoke checks before sharing.
- Version the prototype.
- Share APK/web access with the client through the project group.
- Capture client feedback or explicit approval.
- Apply revision/change policy and preserve all versions.

14. Milestone Approval & Payment

Milestone completion → Client approval → Invoice → Payment → Admin verification → Next phase.

- Project Manager prepares milestone-completion summary.
- Client explicitly approves milestone.
- Finance generates milestone invoice.
- Invoice is shared.
- Payment proof becomes pending verification.
- Admin verifies payment.
- Next gated phase activates only after required verification.

15. Full Development

- Developer Agents read approved requirements, scope, UI and prototype.
- Break work into implementation tasks and dependencies.
- Use specialized developer agents where appropriate.
- Write code, run tests, build applications and resolve defects.
- Maintain version-control and implementation evidence.
- Do not treat code generation alone as completion.

- Client feedback is compared against approved scope.
- Small scope-safe changes may be free according to policy.
- Large/out-of-scope changes become paid change requests where appropriate.
- AI classifies likely change type; commercial exceptions remain policy/Admin controlled.

16. Development Review

- When the development Definition of Done is reached, prepare a client review package.
- Client receives relevant APK/web/system access.
- Client approves or provides feedback.
- Feedback becomes structured tasks.
- Revision loop continues until required milestone approval.
- Developer completion claims do not replace client approval where approval is required.

17. 360° QA & Production Readiness

- Functional, UI/UX, API and database testing.
- Authorization, RLS and tenant-isolation testing.
- Payment/invoice testing.
- Webhook, retry and idempotency testing.
- Concurrency testing where relevant.
- Regression testing.
- Device/browser testing.
- Performance and security checks.
- Build/deployment verification.
- Resolve critical defects according to production policy.
- Required tests pass and production-readiness recommendation is generated.
- Production deployment requires Admin approval and post-deployment smoke/live verification.

18. Final Payment

- Final client acceptance is recorded.
- Final invoice is generated.
- Client pays.
- Payment proof is verified by Admin.
- Final payment becomes VERIFIED.
- Handover gate becomes eligible.

If full payment is required before handover/completion, the system must enforce that invariant rather than relying on agent memory.

19. Handover

- Prepare production APKs/builds and web URLs.
- Provide source/repository access according to contract.
- Provide documentation and relevant API/database/deployment documentation.
- Transfer credentials through a secure mechanism.

- Include invoices/receipts, warranty/support terms, final version/changelog and handover checklist.
- Confirm production readiness and final payment.
- Admin approves handover.
- Send handover through approved channels.
- Store evidence of handover.

20. Project Completion

- Client confirms completion where required.
- Project becomes COMPLETED.
- All historical data remains preserved.
- Generate final project and financial summaries.
- Record final version and handover status.
- Activate Customer Success.

Project completion is not deletion. Completed project history must remain available for audit, support, maintenance and repeat business.

21. Maintenance

- Customer Success Agent evaluates whether maintenance is relevant.
- AI recommends an appropriate maintenance plan based on project/client context.
- Client receives approved maintenance offer.
- Client pays in advance for the selected period unless contract says otherwise.
- Maintenance entitlement activates after verified payment.
- Renewal reminders are automated.
- Without renewal payment, maintenance expires/stops according to policy.

22. Upsell & Repeat Business

- Upsell Agent analyzes completed projects and customer signals.
- Possible services: maintenance, support, hosting, updates, new features, new applications, redesign, integrations, AI automation, SEO/marketing or priority support where offered.
- Only approved service-catalog items may be offered.
- AI ranks opportunities by relevance and likely value.
- Commercial exceptions require Admin approval.
- A new project request is created as a new opportunity under the existing client when it is not an existing-project change.

23. Cross-Stage Rules

- Every stage has state, owner, timestamp and Definition of Done.
- Every client approval references an exact artifact/version.
- Every payment-sensitive transition references verified payment.
- Every important Admin decision is auditable.
- Every AI action is attributable to an agent/model/system actor.
- Every failure has an explicit retry/error/escalation path.

- No silent success, scope expansion, financial assumption or destructive action.
- Client-facing communication is professional and language-aware.

24. Master State Flow

NEW_LEAD → QUALIFIED → REQUIREMENTS_COLLECTED → QUOTATION_DRAFT → ADMIN_APPROVAL → QUOTATION_SENT → NEGOTIATION → WON → ONBOARDING → PAYMENT_PENDING → PAYMENT_VERIFIED → PROJECT_STARTED → UI_IN_PROGRESS → UI_REVIEW → UI_APPROVED → PROTOTYPE_IN_PROGRESS → PROTOTYPE_REVIEW → PROTOTYPE_APPROVED → MILESTONE_PAYMENT → DEVELOPMENT → DEVELOPMENT_REVIEW → DEVELOPMENT_APPROVED → QA → PRODUCTION_READY → FINAL_PAYMENT → HANDOVER → COMPLETED → MAINTENANCE/UPSELL/REPEAT_PROJECT

Actual implementation may use more granular states, but transitions must be explicit, valid, auditable and enforceable.

25. Failure & Escalation

- Low-risk recoverable failure → safe retry.
- Repeated failure → alternative strategy/provider/agent.
- Specialist failure → orchestrator reassigns.
- Client-intent ambiguity → ask the client.
- Policy ambiguity → Admin/Product decision.
- High-risk action → approval gate.
- Payment mismatch → stop transition and escalate.
- Conflicting approval → request clarification.
- Incomplete deliverable → remain in current stage until Definition of Done is satisfied.

26. Complete Audit Timeline

- Lead creation and source.
- Important sales interactions and decisions.
- Requirements and scope.
- Quotation versions and Admin approvals.
- Negotiation and final agreement.
- Onboarding and group creation.
- Invoices, payment proofs and Admin confirmations.
- Project start.
- UI/prototype versions, reviews and approvals.
- Development milestones, feedback and change requests.
- QA findings and fixes.
- Final payment, production and handover.
- Completion, maintenance and upsell activity.

The complete timeline is a core AgencyOS capability, not optional logging.

27. Final Workflow Definition

AgencyOS is a controlled, evidence-based lifecycle in which AI agents perform operational work, clients provide requirements/feedback/approvals/payments, and Admin controls governed authority.

Lead → Sales → Trust → Quote → Approval → Close → Onboard → Payment → Start → Design → Approve → Prototype → Approve → Milestone Payment → Develop → Review → QA → Final Payment → Handover → Complete → Maintain → Upsell → Repeat.

To the client, the experience should feel continuous and professional. Internally, every step must be structured, versioned, policy-checked, testable and auditable.
