

AGENCYOS

CRM / Sales / Lead Management Specification

Document 09 of the AgencyOS Master Documentation Set

FACEBOOK LEAD → WHATSAPP → QUALIFICATION → REQUIREMENTS → QUOTATION →
OBJECTIONS → NEGOTIATION → CONVERSION / LOST

Purpose: Define the complete lead and sales operating system for AgencyOS, from lead acquisition through qualification, trust building, requirements discovery, quotation, negotiation, conversion and post-sale handoff.

1. CRM Core Principle

Every lead must have one traceable lifecycle from source to outcome, with all conversations, requirements, quotes, objections, decisions and follow-ups connected to the same record.

- Lead is the sales opportunity.
- Client is the person/company relationship.
- Opportunity/project is the commercial engagement.
- Conversation is the communication evidence.
- Quotation is a versioned commercial proposal.
- Activity is an action taken by an agent or human.
- Approval is a governed decision.
- CRM state is structured and auditable.
- WhatsApp is a communication channel, not the CRM source of truth.

2. End-to-End Sales Funnel

FACEBOOK/AD LEAD → LEAD CAPTURE → DEDUPLICATION → WHATSAPP CONTACT → QUALIFICATION → REQUIREMENTS → TRUST BUILDING → QUOTATION → OBJECTION HANDLING → NEGOTIATION → ACCEPTANCE → PAYMENT/EXCEPTION → WON → ONBOARDING/PROJECT

- If the lead does not convert, move through the configured LOST lifecycle with a reason.
- A lost lead remains searchable and reusable for future follow-up according to policy.
- A converted lead becomes linked to a client and project without losing sales history.

3. Lead Sources

- Facebook lead forms.
- Facebook/Instagram campaign sources where integrated.
- Direct WhatsApp.
- Website forms.
- Referral.
- Manual Admin entry.
- Existing client/repeat inquiry.
- Other configured sources.

Each lead stores source, campaign/ad metadata where available, landing/source URL where relevant, and acquisition timestamp.

4. Lead Capture

Minimum fields

- Lead ID.
- Name.
- Phone number.
- Email where available.
- Company/business name where applicable.
- Lead source.

- Campaign/ad information where available.
- Created date/time.
- Assigned Sales Agent.
- Language/preferred language.
- Initial inquiry.
- Current status.
- Priority/score.

Capture behavior

- Create lead automatically from integrated source.
- Normalize phone/email.
- Check for duplicate/open lead.
- If matching active client exists, link to client instead of creating a conflicting identity.
- If matching previous lost lead exists, preserve history and create/reopen an opportunity according to policy.

5. Lead Deduplication

A single person should not become five unrelated CRM records simply because they contacted the agency through different channels.

- Normalize phone numbers.
- Normalize email addresses.
- Match known client identity.
- Match active lead.
- Match recent closed/lost lead.
- Flag uncertain matches for review.
- Never merge records automatically when identity confidence is insufficient.
- Maintain source history after merge.

6. Lead Status Lifecycle

Status	Definition	Next
Status	Meaning	Typical next step
NEW	Lead received	Contact/qualification
CONTACTED	Agency has initiated contact	Conversation
RESPONDING	Two-way conversation active	Qualification
QUALIFIED	Enough information to pursue	Requirements/quote
REQUIREMENTS_PENDING	Missing key information	Clarification
QUOTE_DRAFT	Quote being prepared	Review/policy
QUOTE_SENT	Quote delivered	Follow-up/objection
NEGOTIATION	Commercial discussion active	Agreement
AWAITING_ACCEPTANCE	Terms awaiting confirmation	Acceptance
PAYMENT_PENDING	Commercial acceptance but payment not complete	Payment
WON	Successfully converted	Onboarding/project

LOST	Not converted	Record reason/future follow-up
NURTURE	Not ready now	Scheduled follow-up
DISQUALIFIED	Not a valid fit	Close with reason

7. Sales Agent Ownership

- One primary Sales Agent should own the conversation at a time.
- Orchestrator may route tasks to other specialist agents.
- Sales Agent owns qualification, discovery, trust handling, quotation and commercial conversation within policy.
- Sales Agent must see relevant conversation history and lead memory.
- Sales Agent must not access unrelated client data.
- Sales Agent must escalate high-risk/out-of-policy requests.
- Sales ownership transfers must be recorded.

8. WhatsApp Conversion

LEAD SOURCE → CRM RECORD → WHATSAPP IDENTITY → CONVERSATION MEMORY → SALES AGENT

- Store WhatsApp number/channel identity.
- Map incoming messages to the correct lead.
- Preserve conversation history.
- Detect language.
- Detect intent.
- Update lead stage from verified interaction.
- Create structured follow-up task.
- Do not create duplicate leads for every incoming message.

9. Qualification Framework

Required qualification areas

- What does the client want to build?
- Project/service type.
- Target users.
- Platforms: web, Android, iOS, etc.
- Core features.
- Required integrations.
- Design expectations/references.
- Timeline.
- Budget range where appropriate.
- Business urgency.
- Decision-maker status.
- Existing assets/system.
- Special requirements.
- Preferred communication language.
- Trust concerns.

- Payment expectations.

The exact questions should adapt to the project type. The Sales Agent should not interrogate the lead with a rigid checklist when the conversation already provides the answer.

10. Qualification Score

- Need clarity.
- Budget fit.
- Timeline fit.
- Decision-maker involvement.
- Project feasibility.
- Urgency.
- Engagement/response quality.
- Trust/readiness.
- Service fit.
- Commercial potential.

Lead scoring is a prioritization tool, not a substitute for human/business judgment. Admin can configure scoring weights.

11. Requirements Discovery

- Sales Agent extracts requirements from conversation.
- Separate confirmed requirements from assumptions.
- Track unanswered questions.
- Track optional/nice-to-have features.
- Track explicit exclusions.
- Track technical/platform requirements.
- Track design references.
- Track integration requirements.
- Generate a structured requirement summary.
- Send summary for client confirmation when needed.

The requirement summary becomes the foundation for quotation and later project scope.

12. Requirement Confirmation

DISCOVERED → DRAFT SUMMARY → CLIENT CONFIRMATION → APPROVED
REQUIREMENT SET

- Client can correct/add/remove requirements.
- Confirmed requirements receive a version.
- Quotation references the confirmed requirement version.
- Project onboarding references the final approved scope.
- Changes after quotation are handled through negotiation/change-request rules.

13. Trust & Objection Management

Common objections

- You will take my money and disappear.
- I am not sure the project will be completed.
- I want to see work before paying more.
- I need a smaller advance.
- I want to test the UI/prototype first.
- I have had a bad agency experience.
- Your price is high.
- I need more time.

Sales response strategy

- Acknowledge concern.
- Use approved trust-building evidence.
- Show portfolio/demos/samples where relevant.
- Explain milestone-based delivery.
- Explain approval/verification workflow.
- Offer only approved low-advance/no-advance structures.
- Request Admin approval for exceptions.
- Never make unsupported guarantees.

14. Trust Offer Types

- Standard milestone payment.
- Reduced advance with defined milestone gate.
- UI/prototype validation offer.
- No-advance start only if explicitly enabled by policy.
- Other approved commercial offer.

Every trust offer must record exact payment terms, what work is delivered before the next payment, and who approved the exception if required.

15. Quotation Generation

Quote inputs

- Confirmed requirements.
- Service/project category.
- Complexity.
- Platform count.
- Features/integrations.
- Design requirements.
- Timeline estimate.
- Approved pricing rules.
- Discount/offer eligibility.
- Payment milestone configuration.
- Tax/GST configuration.

Quote output

- Quote ID/version.

- Client details.
- Project summary.
- Scope.
- Deliverables.
- Timeline.
- Price.
- Discount if applicable.
- Taxes where applicable.
- Payment schedule.
- Validity period.
- Terms/conditions.
- Next action.

Quote generation is assisted by AI but governed by the Policy Engine.

16. Quotation Versioning

Every material commercial change creates a new quotation version.

- Quote V1 sent.
- Client requests change.
- Quote V2 generated.
- V1 remains historical.
- Only one version is marked current/active.
- Acceptance references the exact version.
- Approval references the exact version.
- Payment/invoice references the accepted version.

17. Quote Approval

- Within policy → auto-approved where configured.
- Out-of-range price → Admin approval.
- Excess discount → Admin approval.
- Special payment plan → Admin approval.
- Special offer → Admin approval.
- No-advance exception → Admin approval.
- High-value project → approval threshold if configured.
- Policy Engine stores decision and policy version.

18. Quotation Delivery

- Send through approved channel.
- Record sent timestamp.
- Record message/document reference.
- Track delivery where provider supports it.
- Link quote to conversation.
- Notify Sales Agent of client response.

- Do not mark accepted simply because quote was delivered.

19. Objection Classification

Price objection

- Compare budget/quote.
- Explain scope/value.
- Offer approved alternative scope/payment plan.
- Use approved discount only.

Trust objection

- Use evidence.
- Explain milestone workflow.
- Offer approved trust structure.

Timeline objection

- Recalculate feasible timeline.
- Do not promise unsupported deadlines.

Feature objection

- Clarify scope.
- Add as paid change/new scope when applicable.

The CRM should store objection type, exact concern, response, outcome and next action.

20. Negotiation Engine

- Track each negotiation round.
- Track requested change.
- Track agency response.
- Track quote version.
- Track discount/offer.
- Track payment-term change.
- Track Admin approval.
- Track client response.
- Track final accepted terms.

Negotiation is a controlled state machine, not an endless chat loop.

21. Negotiation Limits

- Maximum discount.
- Maximum negotiation rounds.
- Minimum acceptable price.
- Minimum advance.
- Maximum payment deferral.
- Maximum free scope additions.
- Maximum autonomous offer value.
- Mandatory escalation after threshold.

- Conversation timeout/follow-up policy.

All limits are configurable in the Admin Approval & Policy Engine.

22. Client Acceptance

ACCEPTANCE REQUEST → CLIENT CONFIRMS EXACT QUOTE VERSION/TERMS →
STRUCTURED ACCEPTANCE → PAYMENT/APPROVED EXCEPTION → WON

- Store acceptance timestamp.
- Store client identity.
- Store accepted quote version.
- Store accepted payment terms.
- Store acceptance evidence.
- If acceptance is ambiguous, request confirmation.
- Acceptance must not be inferred from unrelated conversation.

23. Payment Transition

- After accepted terms, create invoice/payment request according to policy.
- Track payment pending.
- Receive payment proof.
- Verify payment through Finance/Admin workflow.
- Only verified payment unlocks payment-gated project start.
- If no-advance exception is approved, store exact exception and permitted prepayment work.

WON should represent a commercially valid conversion according to configured business definition; payment state remains separately tracked.

24. WON Lead → Client → Project

WON LEAD → CLIENT RECORD → ONBOARDING → PROJECT → PROJECT MANAGER

- Preserve all sales history.
- Copy confirmed requirements into project context.
- Copy accepted quotation/version.
- Copy payment terms.
- Copy trust/expectation context.
- Copy communication preference.
- Create project workspace/group where configured.
- Assign Project Manager Agent.
- Create onboarding tasks.

The client should not have to repeat the entire sales conversation.

25. LOST Lead

Lost reasons

- Price too high.
- No budget.
- Chose competitor.

- Project postponed.
- No response.
- Not a fit.
- Requirements changed.
- Trust not established.
- Timeline mismatch.
- Client cancelled.
- Other configured reason.

Lost workflow

- Record exact reason.
- Record last conversation.
- Record quote version.
- Record objection.
- Record competitor/alternative where voluntarily provided.
- Set nurture eligibility.
- Schedule future follow-up only if permitted.

26. Nurture

- Not ready now.
- Budget later.
- Timeline later.
- Waiting for decision-maker.
- Waiting for funding.
- Needs more trust/evidence.
- Follow-up date.
- Next recommended message.
- Stop/opt-out state.

Nurture should be useful and respectful, not spammy.

27. Sales Follow-Up Engine

- Follow-up based on lead stage.
- Use last meaningful interaction.
- Avoid follow-up immediately after a client response.
- Stop after configured number of attempts.
- Escalate valuable leads with repeated engagement.
- Use personalized context.
- Do not fabricate urgency.
- Respect opt-out and communication policy.
- Record every automated follow-up.

28. CRM Activity Timeline

- Lead created.

- Lead source captured.
- Sales agent assigned.
- Message received/sent.
- Requirement extracted.
- Requirement confirmed.
- Trust concern detected.
- Quote created.
- Quote approved.
- Quote sent.
- Objection logged.
- Negotiation round.
- Discount approved.
- Acceptance received.
- Invoice created.
- Payment proof received.
- Payment verified.
- Lead won/lost.
- Client/project created.

Timeline entries must show actor, timestamp, event type and linked evidence.

29. CRM Search & Filters

- Name.
- Phone/email.
- Lead ID.
- Client.
- Source.
- Sales Agent.
- Status.
- Date range.
- Budget.
- Project type.
- Quote value.
- Trust issue.
- Objection type.
- Negotiation state.
- Won/lost reason.
- Next follow-up.
- Language.
- Campaign/ad source.

30. Sales Dashboard

- New leads.
- Leads contacted.

- Response rate.
- Qualified leads.
- Quotes sent.
- Negotiations.
- Won.
- Lost.
- Conversion rate.
- Average deal value.
- Average sales cycle.
- Follow-up backlog.
- Top objections.
- Top lost reasons.
- Lead-source conversion.
- Sales Agent performance.
- Revenue pipeline.
- Pending Admin approvals.

31. Lead Scoring & Prioritization

- High-value lead.
- High urgency.
- Strong engagement.
- Clear requirements.
- Budget fit.
- Decision-maker.
- Existing client.
- Repeat-project opportunity.
- Trust concern requiring special handling.

Admin can configure score thresholds and priority rules.

32. Sales Agent Context

- Current lead status.
- Client profile if known.
- Recent conversation.
- Conversation summary.
- Requirements.
- Unanswered questions.
- Objections.
- Quote versions.
- Negotiation history.
- Approved offers.
- Follow-up history.
- Relevant policy.
- Sales knowledge/portfolio.

Sales Agent should have enough context to continue a conversation naturally without receiving irrelevant internal data.

33. CRM-to-Project Handoff

- Sales Agent creates structured handoff.
- PM receives confirmed requirements.
- PM receives accepted quote.
- PM receives payment/exception status.
- PM receives client expectations.
- PM receives trust concerns.
- PM receives communication preferences.
- PM receives relevant conversation summary.
- Handoff is recorded.

Handoff completion should be a real workflow event, not simply a note.

34. Admin Controls

- View all leads.
- Reassign Sales Agent.
- Change lead status where authorized.
- Edit/correct CRM data with audit.
- Approve discounts/offers.
- Approve special payment terms.
- Approve trust exceptions.
- View conversations.
- View quote versions.
- Pause automation.
- Mark lead as do-not-contact.
- Merge duplicate records through controlled workflow.
- Inspect audit timeline.
- Configure qualification/scoring rules.

35. CRM Security

- Tenant/client isolation.
- Role-based access.
- Sales Agent sees assigned/authorized leads.
- Finance sees necessary billing information, not unrestricted sales notes.
- AI agents cannot export entire CRM without authorization.
- Sensitive fields are masked where appropriate.
- Audit important CRM changes.
- Protect WhatsApp/contact data.
- Do not expose private client information across projects.

36. AI + CRM Guardrails

- AI can summarize but must preserve source evidence.
- AI can recommend lead score but cannot fabricate facts.
- AI can draft quotes but policy validates pricing.
- AI can handle objections but cannot promise unsupported commitments.
- AI can negotiate within limits.
- AI can recommend offers but policy controls eligibility.
- AI can mark a lead WON only after required conversion evidence.
- AI can mark LOST only with a valid reason/state transition.
- AI must escalate uncertainty.

37. CRM Metrics & Analytics

- Lead-to-contact conversion.
- Contact-to-qualified conversion.
- Qualified-to-quote conversion.
- Quote-to-negotiation conversion.
- Negotiation-to-won conversion.
- Overall lead-to-won conversion.
- Average response time.
- Average quote time.
- Average sales cycle.
- Average deal value.
- Discount impact.
- Trust-offer conversion.
- Lead source ROI where cost data exists.
- Sales Agent performance.
- Lost reason distribution.
- Nurture conversion.
- Repeat-client conversion.

38. Acceptance Criteria

- Facebook leads can be captured into CRM.
- Direct WhatsApp leads can be captured.
- Duplicate leads are detected safely.
- Lead and client identities are connected.
- Every lead has a lifecycle state.
- Sales Agent can own a lead.
- WhatsApp conversations map to the correct lead.
- Language preference is stored.
- Requirements can be structured and versioned.
- Trust objections are recorded.
- Quotes are versioned.
- Pricing/discounts are Policy Engine controlled.
- Negotiation history is preserved.

- Client acceptance references exact quote terms/version.
- Payment state is separate from lead status.
- WON converts into client/project without losing sales history.
- LOST requires a reason.
- Nurture/follow-up is configurable.
- Admin can inspect and override supported CRM states.
- All important CRM events are auditable.
- Sales-to-PM handoff is structured.
- AI cannot invent commercial commitments.
- CRM analytics are available.

39. Final CRM Architecture

LEAD SOURCE → CRM → WHATSAPP → SALES AGENT → QUALIFICATION →
 REQUIREMENTS → TRUST → QUOTE → OBJECTION → NEGOTIATION → ACCEPTANCE →
 PAYMENT/EXCEPTION → WON/LOST → CLIENT/PROJECT

The CRM should make the sales process systematic without making it robotic. AI handles the repetitive conversational work, remembers context, prepares requirements and proposals, follows up and escalates exceptions — while the Policy Engine and Admin remain in control of commercial authority.

The key outcome: every Facebook/WhatsApp lead should have a clear next action, a clear owner, a clear history and a clear reason for where it ended up.
