

AGENCYOS

Finance, Invoice, Payment & Milestone System

Document 15 of the AgencyOS Master Documentation Set

QUOTES • INVOICES • GST/NON-GST • PAYMENT ACCOUNTS • UPI/QR/BANK TRANSFER •
PAYMENT VERIFICATION • MILESTONES • RECEIPTS • RECONCILIATION

Purpose: Define the complete financial workflow from quotation and milestone planning through invoice creation, payment collection, verification, receipts, reconciliation, exceptions, project completion and financial reporting.

1. Core Principle

- Finance is a controlled system of record, not a conversational guess.
- Every quote, invoice, payment, receipt and reconciliation entry has a unique ID and audit history.
- Milestone status and payment status are separate but linked.
- Payment received must be verified before a milestone is treated as financially paid.
- Agents cannot mark money as received merely because a client says 'paid'.
- Tax configuration must be explicit; the system must not invent GST applicability or rates.
- Admin/Finance approval controls exceptions, refunds, write-offs and sensitive changes.

2. End-to-End Financial Lifecycle

• LEAD → QUOTE → CLIENT ACCEPTANCE → PROJECT/CONTRACT → MILESTONE PLAN → INVOICE → PAYMENT INSTRUCTION → PAYMENT RECEIVED → VERIFICATION → RECEIPT → RECONCILIATION → MILESTONE PAID → NEXT MILESTONE → FINAL PAYMENT → PROJECT FINANCIAL CLOSE.

3. Quote System

- Create quote from approved scope and commercial terms.
- Quote contains client, project, line items, quantities, rates, discounts, taxes where applicable, total, validity, payment schedule, milestones and terms.
- Quote versioning is mandatory.
- Client acceptance references exact quote version.
- Accepted quote becomes the commercial baseline.
- Material changes after acceptance use the Change Request/Policy workflow.

4. Quote States

- DRAFT → INTERNAL_REVIEW → SENT → VIEWED → NEGOTIATION → ACCEPTED / REJECTED / EXPIRED / CANCELLED.
- Negotiated price or terms must create a new version or controlled revision.
- Old versions remain auditable.
- Sales agents cannot silently edit an accepted commercial baseline.

5. Invoice System

- Generate invoice from accepted quote/milestone.
- Invoice has unique invoice number, issue date, due date, client details, project, line items, subtotal, discount, tax fields where applicable, total, amount paid, balance due and payment instructions.
- Invoice status: DRAFT, ISSUED, PARTIALLY_PAID, PAID, OVERDUE, VOID, CANCELLED, REFUNDED as applicable.
- Invoice changes after issue require controlled amendment/credit-note workflow where applicable.

6. GST / Non-GST Configuration

- Support GST and non-GST invoice modes.
- Store business tax registration details only when applicable.
- Tax settings are configured by Admin/Finance policy.
- Support configured tax components and invoice presentation.
- Do not hard-code tax rates into agents.

- Tax calculation should be deterministic and auditable.
- Where tax/legal treatment is uncertain, flag for Finance/Admin review rather than guessing.

7. Payment Terms & Milestones

- Project payment schedule is defined at commercial approval.
- Each milestone has: milestone ID, name, amount/percentage, trigger, due condition, invoice reference, payment status and completion status.
- Milestone completion and milestone payment are distinct states.
- Payment gates can prevent the next delivery stage when contract policy requires payment first.
- Partial payments are supported where allowed.
- Overpayments and underpayments are flagged.

8. Milestone Lifecycle

- PLANNED → READY_FOR_INVOICE → INVOICED → PAYMENT_PENDING → PAYMENT_SUBMITTED → PAYMENT_VERIFICATION → PAID → DELIVERY_GATE_OPEN → COMPLETED.
- Exceptions include DISPUTED, OVERDUE, PARTIAL, REFUNDED and WAIVED.
- Project Manager confirms operational milestone completion.
- Finance verifies financial completion.
- Both records remain linked.

9. Payment Accounts

- Configure agency receiving accounts.
- Bank account.
- UPI ID.
- UPI QR.
- Payment gateway account where applicable.
- Other approved payment channels.
- Each account has status, owner/configuration metadata and effective dates.
- Admin can activate/deactivate payment methods.
- Historical invoices retain the payment instructions/version used at issue time.

10. UPI / QR / Bank Transfer

- Invoice can display configured UPI ID/QR and bank-transfer details.
- Client payment instructions should clearly include invoice/reference number.
- Payment submission can capture transaction/reference ID, amount, date/time, payer name and proof.
- Do not treat screenshot upload alone as verified payment.
- Bank/gateway statement or authorized verification is the financial source of truth.

11. Payment Submission

- Client/Admin/Sales can record a payment submission.
- Fields: payment ID, invoice, milestone, amount, method, reference/UTR, payer, payment date, account, proof, submitted by and timestamp.
- Submission status: PENDING_VERIFICATION, VERIFIED, REJECTED, PARTIALLY_VERIFIED, DUPLICATE, REFUNDED.

12. Payment Verification

- Finance/Admin verifies amount, reference, receiving account, date and invoice/milestone mapping.
- Where an integration exists, reconcile against gateway/bank data.
- Manual verification must record verifier and evidence.
- Duplicate references are flagged.
- Unmatched payments enter an exception queue.
- Agents must not fabricate verification evidence.

13. Payment Matching

- Exact match: invoice + amount + reference + account.
- Partial match: payment covers only part of invoice.
- Overpayment: amount exceeds balance.
- Unmatched: payment cannot be confidently mapped.
- Duplicate: same transaction/reference appears more than once.
- Suspicious/uncertain: requires Admin/Finance review.

14. Receipts

- Generate receipt after payment verification according to configured policy.
- Receipt references payment ID, invoice, client, amount, method, date, transaction reference and receiving account.
- Receipt number is unique.
- Receipt status and issue history are auditable.
- Unverified payment should not produce a final verified receipt.

15. Reconciliation

- Compare recorded payments against bank/gateway/account statements or authoritative payment data.
- Identify matched, unmatched, duplicate, missing and discrepant transactions.
- Track reconciliation period.
- Record reconciler, timestamp and source.
- Keep adjustment reasons.
- Reconciliation must not silently alter historical transactions.

16. Finance Exceptions

- Payment received but invoice missing.
- Invoice paid to wrong account.
- Wrong amount.
- Duplicate payment.
- Payment reference mismatch.
- Payment proof unavailable.
- Payment gateway mismatch.
- Refund request.
- Chargeback/dispute.
- Tax/invoice correction.

- Overdue payment.
- Write-off/waiver request.
- Each exception gets an ID, owner, status and resolution trail.

17. Payment Reminder System

- Upcoming due reminder.
- Due-today reminder.
- Overdue reminder.
- Escalation reminder.
- Payment received acknowledgement.
- Reminder channels can include WhatsApp, email or AgencyOS notification according to configuration.
- Do not send reminders after verified full payment.
- Client communication should reference the correct invoice/milestone.

18. Payment ↔ Project Workflow

- Sales closes project → commercial terms accepted → project created → milestone plan locked → invoice issued → payment verified → delivery gate opens.
- Example: 20% advance → UI finalized → UI prototype delivered/reviewed → next milestone invoice → payment verification → development gate.
- Project Manager confirms milestone completion; Finance confirms payment status.
- Both signals feed the Orchestrator.

19. Completion & Final Payment

- Final invoice is issued according to commercial terms.
- Final payment is verified.
- Project Manager confirms operational completion.
- Client confirms project completion where required.
- Financial balance reaches zero or approved exception state.
- Receipt/final financial records are generated.
- Project moves to financial close.
- Handover/maintenance begins according to workflow.

20. Refunds & Reversals

- Refund requests require controlled authorization.
- Record reason, amount, original payment, refund method, approver and timestamp.
- Partial refunds supported where policy allows.
- Refund does not erase original payment history.
- Invoice/milestone balances are recalculated through auditable adjustments.
- Chargebacks/disputes are separate financial states.

21. Discounts & Commercial Exceptions

- Discounts are quote-level or line-item based according to policy.
- Discount authority is role-controlled.

- Large discounts require Admin/approval thresholds.
- Post-acceptance price changes require a controlled revision/change workflow.
- Agents cannot invent discounts to close a lead.

22. Financial Roles

- Sales Agent: prepares/negotiates within allowed limits; does not verify bank receipt.
- Project Manager: confirms milestone operational status.
- Finance Agent: prepares invoices, verifies payments, receipts and reconciliation.
- Admin: controls accounts, policies, exceptions and overrides.
- Client: receives quotes/invoices, submits payments/proof and approvals.
- Orchestrator: coordinates financial state changes without becoming the financial authority.

23. AI Finance Agent Guardrails

- Never claim payment received without verification evidence.
- Never alter issued invoices without the configured controlled process.
- Never guess tax treatment.
- Never expose payment credentials/API secrets.
- Never refund without authorization.
- Never mark a milestone paid from a client message alone.
- Never change financial history to make reconciliation balance.
- Escalate ambiguous transactions.

24. Financial Documents

- Quote.
- Proforma/advance request where configured.
- Tax invoice or configured non-GST invoice.
- Payment instruction.
- Payment submission.
- Receipt.
- Credit note/debit note where applicable.
- Refund record.
- Reconciliation report.
- Statement/account summary.

25. Finance Dashboard

- Total quoted.
- Accepted quotes.
- Invoiced.
- Paid.
- Outstanding.
- Overdue.
- Partially paid.
- Pending verification.

- Unmatched payments.
- Refunds.
- Tax summary.
- Milestone payment status.
- Project-level receivables.
- Cash/account reconciliation status.

26. Project Finance View

- Contract/quote value.
- Discount.
- Tax mode.
- Total payable.
- Payment schedule.
- Milestones.
- Invoices.
- Payments.
- Receipts.
- Outstanding balance.
- Overdue balance.
- Exceptions.
- Refunds.
- Reconciliation state.

27. Audit Trail

- Every financial action stores actor, role, timestamp, previous value where relevant, new value, reason and linked document.
- Track quote versions, invoice versions, payment status changes, verification decisions, refunds, adjustments, approvals and overrides.
- Audit history is append-oriented and protected from ordinary agent edits.

28. Payment Security

- Do not store unnecessary card credentials.
- Use gateway/tokenized flows where applicable.
- Protect bank and UPI configuration.
- Restrict financial permissions.
- Mask sensitive information in ordinary logs.
- Separate production payment credentials from development.
- Audit access to financial configuration.

29. Reconciliation Workflow

- IMPORT/READ AUTHORITATIVE TRANSACTIONS → MATCH → AUTO-MATCH HIGH-CONFIDENCE ITEMS → EXCEPTION QUEUE → MANUAL/ADMIN REVIEW → ADJUSTMENT WITH REASON → RECONCILIATION CLOSE.
- Reconciliation must preserve original transaction evidence.

30. Financial Reporting

- Revenue/invoice report.
- Collections report.
- Outstanding receivables.
- Overdue aging.
- Milestone collection report.
- Payment-method report.
- Tax report fields according to configuration.
- Refund report.
- Reconciliation report.
- Project profitability inputs where configured.
- Reports should identify the period, data source and generated timestamp.

31. Multi-Account / Multi-Entity Support

- Support multiple receiving accounts where business structure requires.
- Each transaction maps to the account/entity used.
- Separate tax/business profiles where configured.
- Prevent cross-entity invoice/payment mismatches.
- Historical documents retain their originating configuration.

32. Admin Controls

- Add/edit/deactivate payment accounts.
- Configure UPI/QR/bank details.
- Configure invoice numbering.
- Configure GST/non-GST modes.
- Configure tax fields/rules.
- Configure payment milestones.
- Configure approval thresholds.
- Approve refunds/waivers.
- Verify or override payment status with reason.
- Run reconciliation.
- View financial audit logs.
- Pause automated payment reminders.
- Lock financial periods where supported.

33. Financial State Machine

- QUOTE_ACCEPTED → MILESTONE_CREATED → INVOICE_ISSUED → PAYMENT_PENDING → PAYMENT_SUBMITTED → PAYMENT_VERIFIED → RECEIPT_ISSUED → MILESTONE_PAID → DELIVERY_GATE_OPEN.
- Any exception routes to controlled review.
- State transitions are permissioned and audited.

34. Payment Verification Evidence

- Gateway transaction ID.
- Bank reference/UTR.
- Receiving account.
- Amount.
- Date/time.
- Invoice/milestone mapping.
- Statement source where available.
- Verifier.
- Verification timestamp.
- Proof attachment where used as supplementary evidence.

35. Financial Handoffs

- Sales → Finance: accepted quote and payment terms.
- Finance → PM: verified milestone payment.
- PM → Finance: milestone completion trigger.
- Finance → Client: invoice/receipt.
- Finance → Admin: exceptions.
- Finance → Orchestrator: payment gate state.
- Final Finance → Project Completion: zero balance/approved exception.

36. Preventing Financial Errors

- Use deterministic calculations.
- Use versioned commercial documents.
- Separate operational completion from payment verification.
- Require exact references for payment matching.
- Flag discrepancies instead of guessing.
- Prevent duplicate invoice/payment IDs.
- Prevent negative/invalid balances unless explicitly supported.
- Use immutable/audited transaction history.
- Do not allow agent self-approval for high-risk financial actions.

37. Example Milestone Flow

- Project value ■100,000 → agreed milestone schedule → 20% advance invoice ■20,000 → client pays via UPI/bank → Finance verifies transaction → receipt issued → UI milestone starts → PM confirms UI prototype milestone → next 20% invoice → payment verified → development gate opens.
- The exact amounts, tax treatment and payment terms come from the accepted commercial baseline.

38. Acceptance Criteria

- Quotes are versioned and auditable.
- Invoices are generated from accepted commercial terms.
- GST/non-GST modes are configurable.
- Payment accounts support UPI, QR and bank transfer.
- Payment submissions are tracked.

- Verification requires evidence.
- Partial/over/under/unmatched payments are supported.
- Receipts are generated only according to verified-payment policy.
- Milestones link operational completion and financial status.
- Payment gates can control project progression.
- Reconciliation is supported.
- Refunds and exceptions are controlled.
- Financial permissions are role-based.
- Audit history is preserved.
- Admin can configure accounts and financial policies.
- Agents cannot falsely declare payment received.
- Final project financial close requires zero balance or approved exception.

39. Final Architecture

QUOTE → COMMERCIAL ACCEPTANCE → PROJECT/MILESTONE PLAN → INVOICE →
 PAYMENT INSTRUCTION → PAYMENT SUBMISSION → VERIFICATION → RECEIPT →
 RECONCILIATION → MILESTONE PAID → DELIVERY GATE → NEXT MILESTONE → FINAL
 PAYMENT → FINANCIAL CLOSE

The Finance, Invoice, Payment & Milestone System becomes the financial control layer of AgencyOS. It connects the commercial agreement to actual money movement and prevents project agents from making unsupported financial claims.

Key outcome: AgencyOS should always be able to answer — what was agreed, what was invoiced, what was paid, where the payment went, who verified it, what remains due, which milestone is unlocked, and whether the project can financially close.
