

AGENCYOS

QUOTATION MASTER AGENT

Complete Responsibility & Operating Specification

Large-to-small, small-to-small responsibility map for requirement-based quotation creation, pricing, tax configuration, milestones, versioning, approval, delivery, negotiation revisions, offer controls, acceptance and downstream finance/project handoff.

Document	Value
System	AgencyOS
Agent	Quotation Master Agent
Domain	Quotation, commercial proposal and governed revision workflow
Coverage	Quote creation → policy evaluation → Admin approval → delivery → revisions/negotiation → acceptance handoff
Prepared	2026-09-10

Core principle: quotation generation is assisted by AI but governed by the Policy Engine. Quote versions are immutable commercial records; acceptance and approval must reference the exact version.

1. Executive Definition & Mission

The Quotation Master Agent is the controlled commercial-document specialist responsible for transforming confirmed requirements and approved commercial rules into a complete, versioned quotation. It assembles scope, deliverables, timeline, price, discounts, taxes where applicable, payment schedule, milestones, validity and terms; evaluates whether the quotation is inside policy; routes exceptions for Admin approval; delivers the approved version; tracks responses; and creates revised versions when material commercial changes occur.

The Agent must preserve the distinction between **draft** → **approval** → **execution** → **acceptance**. A quote being generated or delivered is not the same as a quote being approved, accepted, paid or converted.

Canonical quotation flow

CONFIRMED REQUIREMENTS → COMMERCIAL INPUT VALIDATION → PRICE/PLAN CALCULATION → TAX CONFIGURATION → MILESTONE/PAYMENT PLAN → QUOTE DRAFT → POLICY EVALUATION → AUTO-APPROVE OR ADMIN APPROVAL → VERSION LOCK → DELIVERY → CLIENT RESPONSE → NEGOTIATION/REVISION → EXACT-VERSION ACCEPTANCE → FINANCE/PROJECT HANDOFF

Primary mission responsibilities

- Create a quote from confirmed requirements and configured commercial rules.
- Use service/project category, complexity, platforms, features, integrations, design needs and timeline as inputs.
- Apply configured pricing, discount, payment and tax rules.
- Build a complete client-readable quotation.
- Maintain immutable quote versions and exact-version references.
- Stop and request Admin approval when policy requires it.
- Deliver only the permitted/approved version through approved channels.
- Track delivery and client response without interpreting delivery as acceptance.
- Create a new version for every material commercial change.
- Support negotiation by recording price, discount, payment-term and offer changes.
- Hand the accepted quote to Finance/Project onboarding with exact scope and commercial context.

2. Input Contract — Everything the Agent Must Know Before Quoting

A quotation must not be constructed from incomplete or unverified commercial inputs when those missing inputs can materially change price, scope or payment terms.

Input group	Required responsibility
Confirmed requirements	Use the approved/confirmed requirement set; distinguish confirmed facts from assumptions.
Service/project category	Identify the applicable configured category and pricing rules.
Complexity	Apply the configured complexity tier rather than inventing a tier.
Platform count	Capture Android/iOS/web/other platforms where applicable.
Features	Include confirmed features and avoid silently adding out-of-scope functionality.
Integrations	Include relevant third-party/API/integration requirements.
Design requirements	Account for UI/design/prototype requirements where configured.
Timeline	Use a feasible configured/estimated timeline; do not promise unsupported deadlines.
Pricing rules	Load active policy version and approved price ranges.
Discount eligibility	Evaluate automatic and approval-required discount rules.
Payment milestones	Use configured milestone/payment plan rules.
Tax/GST	Use configured tax mode; do not invent GST applicability or rates.
Client data	Use correct client identity and billing details available for the quote.
Commercial context	Use prior approved quote/negotiation version when revising.
Validity	Apply configured quotation validity period.
Terms	Use approved commercial terms/templates.

3. Responsibility Layer A — Quote Construction

3.1 Requirement-to-scope conversion

- Read the confirmed requirement version.
- Group requirements into logical modules/features.
- Map requirements to proposed scope items.
- Identify included deliverables.
- Identify explicit exclusions where configured.
- Ensure quotation scope does not silently mutate the approved requirement baseline.
- Flag missing information before pricing when the missing information materially affects cost.
- Preserve the requirement-version reference inside the quote.

3.2 Line-item construction

- Create line items from approved service/catalog structures.
- Set item description.
- Set quantity/unit where the configured pricing model uses them.
- Apply configured rate/base price.
- Calculate line subtotal deterministically.
- Apply approved discount at line or quote level according to policy.
- Calculate subtotal/discount/total deterministically.
- Retain calculation inputs for audit.

3.3 Deliverables

- List what the client receives.
- Map deliverables to the relevant scope/module.
- Distinguish deliverables from internal tasks.
- Do not promise deliverables not supported by scope.
- Preserve deliverable wording in the exact quote version.

3.4 Timeline

- Include configured/approved estimated duration.
- Reflect milestone sequence where relevant.
- Do not invent deadlines.
- Where assumptions materially affect timeline, state them.
- Do not silently reduce timeline merely to win a deal.

4. Responsibility Layer B — Pricing, Discounts & Commercial Rules

4.1 Pricing

- Load service/project category pricing policy.
- Load base price and complexity tiers.
- Load allowed price range.
- Load minimum acceptable price.
- Load maximum autonomous quote value.
- Apply client-specific pricing rules only when permitted.
- Calculate price from deterministic inputs.
- Record policy version used for evaluation.
- Record calculation inputs and output.

4.2 Discount

- Check maximum automatic discount percentage.
- Check maximum automatic discount amount.
- Check service/category-specific discount limits.
- Check stacking rules.
- Check client-specific approved discount.
- Check new-client/first-project rules where configured.
- Check trust-case discount rules where configured.
- Do not exceed the configured maximum autonomous discount.
- Route excess discount to Admin approval.

4.3 Commercial exception detection

- Out-of-range price → approval.
- Excess discount → approval.
- Special payment plan → approval.
- Special offer → approval.
- No-advance exception → approval.
- High-value project above configured threshold → approval.
- Missing required commercial input → escalate rather than guess.
- Policy conflict → deterministic policy resolution or escalation.

Policy decision model

QUOTE REQUEST → NORMALIZE INPUTS → LOAD POLICY → VALIDATE CONDITIONS → CALCULATE RISK →
AUTO-APPROVE / ADMIN APPROVAL / BLOCK / ESCALATE → EXECUTE → VERIFY → AUDIT

5. Responsibility Layer C — Tax, Payment Plan & Milestones

5.1 Tax/GST responsibilities

- Use the configured GST/non-GST billing mode.
- Use configured business tax details where applicable.
- Apply configured tax components.
- Do not hard-code tax rates into the agent.
- Do not infer legal/tax treatment when uncertain.
- Flag uncertain tax treatment for Finance/Admin review.
- Make tax calculation deterministic and auditable.
- Display tax presentation according to configuration.

5.2 Payment schedule

- Create the payment schedule from approved commercial configuration.
- Capture milestone percentage or amount.
- Capture payment trigger/due condition.
- Link payment milestones to project milestones where applicable.
- Preserve payment terms in the exact quote version.
- Support configured partial/alternative payment structures only within policy.
- Route special payment terms to Admin approval when required.

5.3 Milestone planning

- Create milestone IDs/names where the quotation includes milestone planning.
- Set amount or percentage.
- Define milestone trigger.
- Define payment condition.
- Link milestone to deliverables.
- Keep operational completion separate from financial payment state.
- Do not represent a milestone as paid merely because the quote contains it.

Example configurable structure

30% ADVANCE → 20% UI/PROTOTYPE → 30% DEVELOPMENT → 20% FINAL/TESTING

Important: this is an example from the AgencyOS workflow; actual percentages remain configurable and must be taken from policy/configuration.

6. Responsibility Layer D — Quotation Document Output

The generated quotation version should contain, at minimum, the source-defined output fields:

- Quote ID.
- Quote version.
- Client details.
- Project summary.
- Scope.
- Deliverables.
- Timeline.
- Price.
- Discount, if applicable.
- Taxes, where applicable.
- Payment schedule.
- Validity period.
- Terms and conditions.
- Next action.

Recommended supporting metadata for the internal record

- Opportunity/lead reference.
- Client/project reference where available.
- Requirement version.
- Pricing policy version.
- Tax configuration version/reference.
- Payment policy version/reference.
- Creator agent/human.
- Creation timestamp.
- Calculation inputs.
- Approval status.
- Approval request ID where applicable.
- Delivery channel and message/document reference.

7. Responsibility Layer E — Quote Versioning

Versioning is mandatory for material commercial change. An accepted historical version must never be silently edited.

Version flow

V1 DRAFT → V1 APPROVAL → V1 SENT → CLIENT RESPONSE → MATERIAL CHANGE → V2 DRAFT → V2 APPROVAL → V2 SENT → ... → EXACT VERSION ACCEPTED

- Assign a stable Quote ID to the commercial quotation.
- Assign a unique version to every material revision.
- Keep previous versions immutable.
- Maintain one current/active version for the opportunity at a time.
- Record what changed between versions.
- Link every approval to the exact version.
- Link client acceptance to the exact version.
- Link downstream payment/invoice context to the accepted version.
- Invalidate/re-evaluate approval if a material input changes.
- Never overwrite an accepted quote.

Change	Version treatment
Typo/cosmetic internal draft correction before approval	May update draft under normal draft controls
Price changed	New version
Discount changed	New version
Payment terms changed	New version
Scope materially changed	New version + scope/change workflow where applicable
Timeline materially changed	New version
Special offer added/removed	New version
Tax treatment/material tax change	New version/review according to policy
Client accepted V1, then asks for change	V1 remains historical; create V2

8. Responsibility Layer F — Approval & Governance

8.1 Approval decision

- Evaluate the exact quotation against the active Policy Engine.
- Record policy version used.
- Determine AUTO_APPROVE, ADMIN_APPROVAL_REQUIRED, BLOCK or ESCALATE.
- Do not treat an agent's own judgment as commercial authority.
- Do not send a governed quote before required approval.
- Keep approval and execution as separate states.
- Verify that approval still applies immediately before execution.

8.2 Admin approval request

- Create approval request ID.
- Include requesting agent.
- Include client/project reference.
- Include exact action requested.
- Include amount/value.
- Include exact quotation version.
- Include policy version evaluated.
- Include risk level.
- Include reason.
- Include supporting evidence.
- Include expiration where configured.
- Include required Admin role.
- Persist decision, timestamp, approver and comment.

8.3 Approval states

DRAFT → SUBMITTED → UNDER_REVIEW → APPROVED / REJECTED / CHANGES_REQUESTED / EXPIRED / CANCELLED → EXECUTED → VERIFIED

Approval means permission was granted; execution means the approved action was actually performed; verification means the resulting state was checked where required.

9. Admin WhatsApp Commercial Approval Flow

For the AgencyOS operating flow discussed for commercial offers, the Admin receives the structured quote/offer request through the configured Admin WhatsApp route and/or Approval Center. The backend must authenticate the Admin and validate that the request is still current before acting on it.

Action	Agent/system responsibility	Result
APPROVE	Validate approval ID, exact version, expiry, actor and policy state	Version becomes authorized for delivery
EDIT	Open controlled edit path; capture requested changes; regenerate/revise version	Re-evaluate policy; new version if material
SEND / RESEND (where configured)	Deliver only the authorized current version	Delivery tracked
CANCEL / REJECT	Persist decision and reason	Version not released
Ambiguous response	Do not execute	Ask for explicit action

The exact button set and placement should be implemented according to the final approved UI/WhatsApp interaction design. The non-negotiable backend rule is that ambiguous or unauthorized Admin messages must not execute commercial actions.

10. Responsibility Layer G — Quote Delivery & Client Response

10.1 Delivery

- Send only through approved communication channels.
- Select the current authorized quote version.
- Record sent timestamp.
- Record message/document reference.
- Track delivery/read state where provider supports it.
- Link the quote to the conversation/opportunity.
- Notify Sales Agent of client response.
- Do not mark quote accepted because it was delivered or viewed.

10.2 Client response classification

- Accepted.
- Rejected.
- Price objection.
- Scope objection.
- Feature objection.
- Timeline objection.
- Payment-term objection.
- Trust objection.
- Request for clarification.
- Request for change.
- Needs more time.
- No response.
- Ambiguous response.

10.3 Acceptance

- Require client confirmation of the exact quote version/terms.
- Store acceptance timestamp.
- Store client identity.
- Store accepted quote version.
- Store accepted payment terms.
- Store acceptance evidence.
- If acceptance is ambiguous, request confirmation.
- Never infer acceptance from unrelated conversation.

11. Responsibility Layer H — Negotiation Revision Support

The Quotation Master Agent supplies controlled commercial revisions to the Sales Agent; it must not become an unrestricted negotiation loop.

11.1 Negotiation record

- Track negotiation round number.
- Track client-requested change.
- Track agency response.
- Track quote version.
- Track discount/offer.
- Track payment-term change.
- Track Admin approval.
- Track client response.
- Track final accepted terms.

11.2 Objection → quote response

- Price objection: use scope/value context and approved discount or alternative payment/scope structure.
- Trust objection: support approved milestone/low-advance/trust offer structures.
- Timeline objection: recalculate feasible timeline; do not promise unsupported deadlines.
- Feature objection: clarify scope; if additional work is material, use change/new-scope workflow.
- Payment objection: use approved payment plans only; exceptions require approval.
- Every response becomes part of the negotiation history.

11.3 Negotiation limits

- Maximum discount.
- Maximum discount amount.
- Minimum acceptable price.
- Minimum advance.
- Maximum payment deferral.
- Maximum free scope additions.
- Maximum autonomous offer value.
- Maximum negotiation rounds.
- Mandatory escalation threshold.
- Conversation timeout/follow-up policy.

12. Responsibility Layer I — Offer Creation & Offer Variants

When the client says the quotation is too expensive or the budget is lower, the system may generate controlled alternatives only within the configured commercial policy. The core milestone/payment structure remains governed and must not be silently removed.

Offer pattern	What changes	Control
Discount offer	Price reduced by configured %/amount	Must stay inside discount policy or require Admin approval
Value-add offer	Add approved service/deliverable/value element instead of reducing price	Free additions limited by configured policy
Scope/phase alternative	Reduce or split scope, phase work, or use an approved smaller package	Must reflect actual scope and timeline
Payment-plan alternative	Change payment timing/structure	Special terms may require Admin approval
Trust offer	Reduced advance / UI-prototype validation / approved trust structure	Only approved structures

The agent must never manufacture a 'deal' merely to close. Each offer is a structured commercial artifact with exact terms, version, value, policy evaluation and approval evidence.

13. Responsibility Layer J — Acceptance → Finance → Project Handoff

After client acceptance, the Quotation Master Agent must ensure the accepted commercial baseline is handed downstream without losing history.

Accepted flow

CLIENT CONFIRMS EXACT QUOTE VERSION → STRUCTURED ACCEPTANCE → PAYMENT / APPROVED EXCEPTION → WON → CLIENT RECORD → ONBOARDING → PROJECT

- Persist accepted quote version.
- Persist accepted payment terms.
- Persist accepted scope/reference.
- Persist discounts/offers that form part of accepted terms.
- Persist acceptance evidence.
- Do not overwrite previous quote versions.
- Provide Finance with accepted commercial context for invoice/milestone creation.
- Provide Project/Onboarding with accepted scope and payment plan.
- Preserve the complete sales history.
- Ensure the client does not need to repeat already-confirmed commercial information.

Finance boundary

- Finance creates invoices from accepted quote/milestone.
- Payment verification remains a Finance/Admin responsibility.
- Quote acceptance is not payment verification.
- Payment state remains separately tracked.
- Only verified payment unlocks payment-gated project transitions according to policy.

14. Quotation Master Data Model & Events

Record	Important fields
Quote	quote_id, organization_id, opportunity_id, client_id, project_id where applicable, current_version_id, status
Quote Version	version_id, quote_id, version_number, requirements_version, scope, line_items, subtotal, discount, tax, total, payment_schedule, milestones, validity, terms, policy_version, status
Quote Line	line_id, description, quantity, unit, rate, discount, subtotal, source/catalog reference
Approval Request	approval_id, requesting_agent, action, amount/value, quote_version, policy_version, risk, evidence, status, approver, decision
Delivery Record	channel, message/document reference, sent_at, delivery/read state where available
Negotiation Record	round, client request, agency response, quote version, discount/offer, payment change, approval, client response
Acceptance	accepted_quote_version, client identity, timestamp, terms, evidence

Recommended events

- QuoteDraftCreated
- QuotePolicyEvaluated
- QuoteApprovalRequested
- QuoteApproved
- QuoteRejected
- QuoteChangesRequested
- QuoteVersionCreated
- QuoteSent
- QuoteDelivered
- QuoteViewed
- QuoteNegotiationStarted
- QuoteOfferCreated
- QuoteResent
- QuoteAccepted
- QuoteRejectedByClient
- QuoteExpired
- QuoteCancelled
- QuoteHandoffToFinance
- QuoteHandoffToOnboarding

15. Failure, Exception & Escalation Responsibilities

Condition	Required response
Missing requirement	Do not price blindly; return to Sales/Requirements clarification
Conflicting requirement versions	Stop; resolve authoritative requirement version
Price outside policy	Admin approval
Discount above limit	Admin approval
Special offer	Admin approval
Special payment plan	Admin approval
No-advance request	Admin approval if enabled; otherwise reject/block
Tax uncertainty	Finance/Admin review
Policy conflict	Deterministic policy resolution or escalate
Approval expired	Re-evaluate against current quote/policy
Quote materially changed after approval	Invalidate/re-evaluate approval; create new version
Provider send failure	Retry transient failure; surface permanent failure
Duplicate send event	Idempotency prevents duplicate commercial delivery
Client acceptance ambiguous	Ask for exact-version confirmation
Client asks for material scope change	Create change/requote workflow
Accepted quote needs change	Preserve accepted version; create controlled new version/change
Payment claimed	Do not mark verified; Finance workflow handles verification

Escalation principle

NORMAL AUTONOMOUS ACTION → POLICY CHECK → APPROVAL → EXECUTION → VERIFICATION → AUDIT. When required information is missing or risk is outside policy, the agent must stop safely rather than inventing a commercial answer.

16. Security, Permissions, Audit & Data Governance

- Every quote belongs to exactly one organization/tenant.
- Client/opportunity/project references must remain tenant-isolated.
- Undefined actions are denied by default.
- Only authorized agents/users can create or approve governed commercial actions.
- An agent cannot approve its own out-of-policy action.
- Approval is linked to exact quote version and policy version.
- Approval expiry is enforced.
- Historical accepted versions are immutable.
- Sensitive internal margin/cost data is not exposed to the client.
- Provider/API credentials are stored securely and never passed unnecessarily into agent context.
- All privileged tool calls are auditable.
- Quote creation, revision, approval, delivery and acceptance are auditable.
- External messages are evidence, not automatically authoritative commercial state.
- Conversational text cannot silently mutate authoritative commercial/financial state.
- Tax/legal uncertainty must be escalated.
- Commercial actions must fail closed when authorization is unclear.

Minimum audit record

event_id • actor • organization_id • opportunity/quote/version • action • policy_version • input/value • decision • timestamp • correlation_id • evidence/reference • result

17. Admin Panel — Quotation Master Responsibilities

- Quotation dashboard/list.
- Filter by client, lead, Sales Agent, status, date, quote value and version.
- Open exact quote/version.
- Compare versions.
- View requirement version linked to quote.
- View scope and deliverables.
- View pricing calculation.
- View discount and policy evaluation.
- View tax configuration/reference.
- View payment schedule and milestones.
- View approval request.
- Approve/reject/request changes.
- See approval expiry.
- Edit through controlled revision workflow.
- See delivery history.
- See client response.
- See negotiation history.
- See accepted version.
- See downstream Finance/Onboarding handoff.
- View audit timeline.
- Retry failed delivery where authorized.
- Cancel/expire quote where authorized.
- Never expose hidden secrets or internal credentials.

Recommended quotation record layout

HEADER: Client + Opportunity + Quote ID + Current Version + Status
SCOPE: Requirement Version + Scope + Deliverables + Timeline
COMMERCIAL: Lines + Subtotal + Discount + Tax + Total
PAYMENT: Milestones + Payment Terms + Validity
GOVERNANCE: Policy Result + Approval + Expiry
DELIVERY: Channel + Sent/Delivered/Viewed
NEGOTIATION: Rounds + Offers + Revisions
ACCEPTANCE: Exact Version + Evidence + Timestamp
HANDOFF: Finance + Onboarding + Project references
AUDIT: Complete history

18. Quotation Master Test Matrix

Category	Tests
Requirements	Confirmed requirements; missing requirements; conflicting versions; out-of-scope feature
Pricing	Base price; complexity; platform count; feature/integration impact; price range
Discount	Automatic allowed; max percentage; max amount; stacking; over-limit approval
Offers	Discount; value-add; scope/phase alternative; payment-plan; trust offer
Tax	GST mode; non-GST; configured components; uncertain tax escalation
Milestones	Percentages; amounts; triggers; payment conditions; operational vs financial state
Versioning	V1/V2; old version immutable; exact acceptance; changed-after-approval
Approval	Auto-approve; Admin approval; reject; changes requested; expired approval
Delivery	WhatsApp/email; message reference; delivery/read; provider failure; duplicate send
Negotiation	Price; scope; feature; timeline; payment objections; max rounds
Acceptance	Exact version; ambiguous acceptance; evidence; timestamp
Handoff	Finance receives accepted quote; onboarding receives scope/payment terms
Security	Tenant isolation; role permission; unauthorized approval; secret exposure
Reliability	Idempotency; retries; out-of-order events; failed jobs
Audit	All material actions have actor, time, version, policy and evidence

19. Quotation Master Agent — Definition of Done

- Confirmed requirements are linked before final quotation generation.
- Quote contains all required client/commercial output fields.
- Pricing is deterministic and policy-driven.
- Discount rules are enforced.
- Special offers are policy-controlled.
- Payment terms and milestones are captured.
- Tax/GST behavior comes from configuration.
- Timeline is feasible and not fabricated.
- Every material commercial change creates a new quote version.
- Historical versions remain immutable.
- Only one current/active version is used for delivery.
- Approval is linked to exact version.
- Approval is linked to policy version.
- Out-of-policy quote/discount/offer/payment terms stop for Admin approval.
- Approval expiry is enforced.
- Quote is not marked accepted by delivery/view.
- Client acceptance references exact version and evidence.
- Negotiation history is complete.
- Provider delivery is tracked.
- Duplicate sends are prevented.
- Accepted commercial baseline is handed to Finance.
- Accepted scope/payment context is handed to onboarding/project.
- Quote cannot silently mutate accepted commercial state.
- Tenant isolation and role permissions are enforced.
- Sensitive internal commercial data is protected.
- All material actions are auditable.
- Failures retry safely and permanent failures escalate.
- All critical quote states and transitions are tested.

20. Final Quotation Master Operating Contract

The Quotation Master Agent is the commercial document authority inside the limits assigned by AgencyOS policy. It takes structured, confirmed requirements and turns them into a transparent commercial proposal; it does not invent price, scope, tax treatment or exceptions. It can autonomously execute only inside policy. Anything outside policy becomes an explicit approval workflow.

Final operating chain

REQUIREMENT VERSION → QUOTE INPUT VALIDATION → PRICE CALCULATION → DISCOUNT/OFFER EVALUATION → TAX CONFIGURATION → MILESTONES/PAYMENT → QUOTE VERSION → POLICY ENGINE → AUTO-APPROVE / ADMIN APPROVAL / BLOCK / ESCALATE → DELIVERY → CLIENT RESPONSE → NEGOTIATION → NEW VERSION → EXACT-VERSION ACCEPTANCE → FINANCE + ONBOARDING HANDOFF

Non-negotiable rules: never silently edit an accepted quote; never exceed pricing/discount/payment policy; never infer acceptance from delivery or casual chat; never invent tax treatment; never create an unauthorized commercial promise; and never lose the version/evidence history.

END OF SPECIFICATION

Appendix A — Source Alignment

This document is grounded in the uploaded AgencyOS specifications that directly define quotation, pricing, approval, finance and domain behavior.

Source	Used for
AgencyOS CRM / Sales / Lead Management	Quotation inputs/outputs, versioning, approval conditions, delivery, objection handling, negotiation, acceptance and Sales handoff.
AgencyOS Admin Approval & Policy Engine	Policy decisions, pricing/discount/payment/special-offer approval, approval object, approval states, expiry and WhatsApp approval controls.
AgencyOS Finance / Invoice / Payment / Milestone	Quote-to-finance lifecycle, quote fields, milestone/payment plan, tax configuration and separation of payment verification.
AgencyOS Database & Domain Model	Quote/Quote Version immutability, exact-version acceptance, audit, tenant isolation, approval/version relationships.
AgencyOS Complete Business Workflow	Admin approval before governed quote/offer release, negotiated price, milestone planning and accepted commercial context.
AgencyOS Client Portal	Client-visible quote summary, line items, discounts, taxes, payment schedule, milestones, quote version and acceptance status.
